It seems to me that there was a series of articles in Analog a few years back about just such a project, called "Atari Zucchini" (the idea being that extra Ataris, like homegrown zucchini, can be hard to get rid of). I think they were written by Lee Brilliant. So whatever the story was, you could make one machine act as a print spooler for the other. Using the other machine to handle disk I/O might be considerably more difficult: you would have to worry about asynchronous data flow, for example, when you were loading from the disk and the other Atari had finished the transfer. I mean, if you're going to do that, why not just build a complete networking system?

Jake

I know I've said this a number of times before, but it sounds like you want SIO2PC, only you want to use another 8bit instead of a PC clone as the server. If you are serious about this project, you might want to get the SIO2PC files from atari.archive.umich.edu in the atari/8bit/sio2pc directory (If I remember correctly).

The problem with SIO2PC that you will have is that you need to convert the signals back to SIO signals for the other Atari instead of RS-232 signals. I wouldn't be surprised if this is actually an easier task.

(I remember when I wanted to design a game where you had 2 Atari's interacting by running a SIO cable between them--unfortunately, it seems that you have to cross some wires or something.)

a644690c@edinboro.edu ("Adam J. Conover") writes:
|> My question is: Why do us Atari 8-bitters really
|> need any commercial support? Software is not written
|> by companies but by people. If people (Atari owners)
|> want to write quality software and give it away, what
|> is the difference?

I think the real issue is that several excellent programs
have been produced for the Atari in the past, are no longer
published, and are becoming increasingly hard to find.
Classics like M.U.L.E., Pinball Construction Set, Archon,
Alternate Reality, Ballblazer, Rescue on Fractulus,
Koronis Rift, etc. etc. are all highly desirable titles.

You really can't buy them in stores anymore, because
everything pretty much sold out a long time ago. Pretty
much the only way to get copies now is to buy a used
original, or make a pirate copy. And what happens when
the originals go kaput? I wonder when my copy of M.U.L.E.
will no longer boot - and I don't have the hardware to
copy it.

It isn't legal to make a pirate copy of a software title
which is out of print, but is it ethical? I think that's
the real question.

I don't believe that it is ethical to violate the law unless the law is clearly unjust. I can't see this as a clear case. No, it is not ethical.

Piracy is not the solution (though it is easy and tempting). The solution is to get the software legally available--either by getting companies to release software as shareware or freeware, or to get a group of enthusiasts to buy the rights. Perhaps this could be done by the Atari Classics magazine--they could give the software that they've bought to their subscribers free and let non-subscribers pay $5-10 and distribute it as shareware. The profits could be placed in a fund for the purchase of rights to additional software.

3224. Searching for copyrights

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-07 01:45:37 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Aug7.014537.4823@dartvax.dartmouth.edu>
Source record: 110020

Has anyone tracked down the copyright holders for companies that no longer exist? Perhaps we could start a FAQ type list of companies that produced 8-bit software and their current status, including the address that we would write to concerning 8-bit stuff. I could easily maintain such a list, so why not? If anyone has any information on 8-bit software companies, let me know.

The following information would be nice:
The name of the company (or names) that it used when selling 8-bit software.
The present status of that company (bankrupt, still alive, sold to...).
The address for the company.
The "best" software that they produced--if we can get the rights to something, where should we start?

Please, don't assume that I someone else has already provided the info on any company--it's easier to trash duplicate mail than to create data from nothing.

Source record: 110031

I'm sure the 800 was NOT used in the production of Star Wars. Star Wars was released in 1977, before the 800 was. The Apple II had just come out, along with a few others (Altair, etc.) I guess it could have been used for The Empire Strikes Back, though....

Same deal. edinboro.edu doesn't have an IP address associated with
it (i.e., it isn't the name of a computer on the Internet), so your
system's test bounce is failing. a644690c@edinboro.edu is probably
a good mail address anyway. I think your mailer is screwy for wanting
to test bounce every address before mailing to it.

Does that last line there "/u3/ ... Sent" mean it sent your message to
Adam anyway?

I just realized that this is being crossposted to news.group, not
news.groups! Normally discussion of new groups should take place
exclusively on news.groups and not be crossposted. I suspect that
the original RFD contained the same error, so it needs to be posted
to news.groups before it will be valid.

Please move the discussion to news.groups. If your site does not receive
news.groups, talk to your system administrator and fix it. If you do not
want to read all the other messages on news.groups, learn how to use a
kill file with your news reader (I use nn and it is quite trivial).

Sender: jonc@status.gen.nz (Jon Clarke, Z*NET PC Assistant Publisher)

Request For Discussion (RFD): comp.sys.atari.znet

Status: unmoderated

This is an official Request For Discussion (RFD) for the creation of a
Usenet newsgroup called comp.sys.atari.znet

Charter:

Comp.sys.atari.znet is for discussion of all aspects of the ASCII Magazines
produced by Z*NET including feeds from Z*NET FNET (FoReM NeT, Gatewayed via
The Z*NET Global News Gateway "status.gen.nz") also including discussion on
all aspects of the following

- Atari Explorer On-line
- Z*NET PC
- Z*NET Fido echo's (Zone 3)
- Z*NET FNET

Topics would include those current discussed in the Z*NET FNET echo, GEnie,
Delphi, Compuserve, Bix, Fido and comp.sys.atari.st which cover Z*NET Topics

- Letters to the Editor
- Current issue feedback
- Columnist's reply
- Letters to the Z*NET Global Crew
- Atari Explorer On-line
- Z*NET PC
- Z*NET FNET echo's
- Z*NET Fido echo's (zone 3)
- Z*NET Pacific
- Z*NET Europe
- Z*NET USA
- Z*NET Canada

Topics will also include an open forum to discuss topics of interest with the
Director of Communications at Atari Inc, USA and will be open to all Atari
based computers ie 8bit Series, ST Series, PC Series etc. Feedback will be
gatewayed back to fido net and FNET thus allowing a great interaction of users
across three networks.

Discussion of this proposal should be posted to news.groups. As per the Guidelines, discussion that occurs there is the only discussion that counts. If your site does not carry news.groups, and you are interested in this discussion, get your administrator to carry the group.

The owner of Atari-Ville also owns H&R Block and a few other stores. As far
as I know, they have had a couple of fires that have wiped out their stores
and have relocated to San Antonio and then back to Boerne andow I don't know
where they are.

I remember reading in an old compute about a networking device that
would allow several 8-bits to use a disk drive and printer. This sounds
like something I would like to see, since I have two 800XLs and a 400, I
would like to set up some network to share my printer and disk drives
among them. Any ideas?

> XL though.

To be able to get by wihtout adding your own handler would require
you to use the SIO port. As someone mentioned, there was a series of
articles in Analog call Atari Zuchini that allowed you to use a computer
for a printer spooler. This is a lot more simplistic than what you want,
which is practically a network. (Which is something I would like to see,
using either another 8bit, or maybe an IBM or ST for a server.)

Later.....

For Sale:

1050 drive with Happy Enhancement, has write protect override switch
added to front, for always write, never write, or standard operation.
Comes with Happy 7.1 Software, which among other things allows reading and
writing to an IBM Formatted 180K disk. Asking $200 or best offer, this
is a must sell!

Also have a Microprint printer cable, allows standard Centronics Printers
to be used with Atari 8 bit. $15.00 OBO.

Buyer(s) pays shipping. Please send responses to jjmcwill@mtus5.cts.mtu.edu

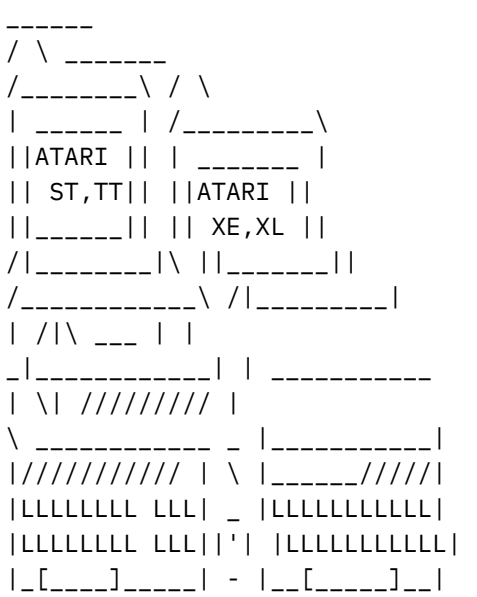
3240. Cleveland Free-Net Atari SIG Announcement

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-08 02:26:50 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Aug8.022650.21672@usenet.ins.cwru.edu>
Source record: 110034

INTRODUCING...

The NEW...



CLEVELAND FREE-NET ATARI SIG

The Atari SIG is a Special Interest Group servicing all Atari computer users and Lynx video game players. The SIG Operators that help run the Atari SIG are volunteers that have an interest in Atari computers and Atari products. The opinions of each SIGOp do not necessarily reflect the Atari SIG nor that of the Cleveland Free-Net. The Atari SIG is run by individuals and is no way affiliated with Atari Corporation. The "Atari" name, logo, and any other Atari products mentioned here are copyrighted by Atari Corporation. The Atari SIG is made possible by the NPTN, CWRU, INS, and you, the user who contributes time and information. The Central Atari Information Network (C.A.I.N.) is the official user group of the Cleveland Free-Net Atari SIG. The meetings are usually electronic and are held in the Multi-User Chat area on Free-Net. A live gathering of C.A.I.N. members is held once a year. The C.A.I.N. official newsletter is published in electronic form once a month. The Atari SIG can be accessed by the phone number: "216/368-3888" at either 300, 1200, or 2400 baud. It can also be accessed by users around the nation or world for free by using "telnet" at their college or business by the following Internet addresses: 129.22.8.82, 129.22.8.75, 129.22.8.76, freenet-in-a.cwru.edu, freenet-in-b.cwru.edu, cwns16.INS.CWRU.Edu, cwns9.INS.CWRU.Edu, or cwns10.INS.CWRU.Edu. There is no charge for the use of the Atari SIG or the Cleveland Free-Net. The information within

this SIG is believed to be reliable but cannot be guaranteed.

In the Atari SIG, there are many different areas which you may use. We ask that you help out in these areas because we cannot make the Atari SIG a success without you.

Here is a small overview of each section in the Atari SIG:

One of the first sections is the SIG Menu Outline. This outline is here to help you find what you are looking for in this SIG.

The Atari News area is the place to go for all of the latest news relating to Atari. In this area, you will find the Atari News (All) board, the Atari SIG Newswire (Weekly), the Free-Net Atari SIG Newsletter (Monthly), Atari Show Announcements listing, and a Rumor Mill board that does not require users to leave their names when posting rumors.

The General Bulletin Board is the main place for Atari computer users to meet and discuss any problems, suggestions, or experiences that they might have.

The 8-Bit Computers Support Area is the place to be when it comes to support for the 8-bit Atari. This area includes a computer description, FAQ list, 8-bit news, bulletin board, programming forum, product summaries, product reviews, tips & tricks board, file area, all Z*Magazine issues, recent Info-Atari8 Digests, and an 8-bit user directory.

The 16/32-Bit Computers Support Area is here specifically to meet the needs of the ST, TT, and hopefully new Falcon computer users. There is a published articles board, a computer description file, FAQ list, 16/32-bit news, bulletin board, MIDI forum, programming/developing forum, tips and tricks board, file area, online magazines, and 16/32-bit user directory.

The Portfolio Support Area brings support to users of one very small computer. The area includes a description file, Portfolio news, bulletin board, programming forum, product summaries, product reviews, tips & tricks board, file area, Portable Addiction Magazine, and a Portfolio user directory.

The Lynx Support Area is for owners of the first color portable video game system (not to mention the best). There is a description file, published articles board, FAQ list, Best & Worst of 1991 file, Lynx news, bulletin board, Atari Explorer game card summaries board, game card reviews, rank Lynx games area, tips & tricks board, record high scores reported board, APE Newsletter, Portable Addiction magazine, and a Lynx player directory.

The Wanted & For Sale Board is the market place for Atari users. This is where users may post messages to sell their equipment or just let others know what they are looking to buy. Businesses may not use this board to sell their merchandise.

In the Voting Booth, users are allowed to post and vote on Atari related issues. There are complete text files to help you in this area. It is a great new addition to the SIG.

The Atari Library is a place for users to get old Atari SIG news and information, Online Magazines, Atari SIG Newsletters, various documents in the Miscellaneous Information board, text files in the Information Base, and Atari SIG Logs.

The Atari SIG Newsletter is put together in The Newsroom area of the Atari SIG. All interested users should visit the area to see what they can do to help put together the newsletter.

The Help-Line is the place to ask general questions about your Atari computer. The SIGOps manning the Help-Line are ready, willing, and able to help. Your question will be answered as soon as possible.

And finally there is a directory of all the Atari SIG members. This section is a listing of all the Atari SIG members. If you are an Atari user and this all looks good to you then please take the time to sign up now and your name will be added to the list. Once your name is on the list, you may be contacted through personal messages if any important news should come up related to Atari or the Atari SIG.

The posting of any abusive, obscene, offensive, or inflammatory messages may be deleted. It goes without saying that illegal material is prohibited. Any illegal material that you post will be deleted and your Cleveland Free-Net access may be revoked.

If you have any comments or suggestions on how to make the Atari SIG better then please send the Atari SIGOps a message at:

xx004@cleveland.Freenet.Edu

Thanks goes out to all those who are helping in contributing news, online magazines, reviews, and information. Their names are listed in the header of the material that you read.

Thank you & enjoy,

Michael Current, aa700 (8-Bit Computers Support Area)
Peter Haller, aa596 (8-Bit,16/32-bit Programming Forum, MIDI Forum)
Fred Horvat, aa778 (Portfolio Support Area, Portfolio Programming Forum)
Mark Leair, aa338 (Voting Administrator, Newsletter Editor)
J. J. Lehett, aa400 (16/32-Bit Computers Support Area)
Scotty Meredith, aa519 (Newsletter Editor)
Len Stys, aa399 (Lynx Support Area, SIG Manager)
Doug Wokoun, aa384 (Atari News)

Your Atari SIG Operators

The Cleveland Free-Net has been upgrading systems and adding more server ports so if you cannot access Free-Net from the above nodes, try these:

freenet-in-a.cwru.edu = cwns5.ins.cwru.edu = 129.22.8.47
freenet-in-b.cwru.edu = cwns6.ins.cwru.edu = 129.22.8.48
freenet-in-c.cwru.edu = cwns6.ins.cwru.edu = 129.22.8.48

Thank you and we hope to see you there!

Sincerely,

Len Stys (aa399@cleveland.freenet.Edu)

If you decide to use either an RS-232 link or a joyport link, you'll have a lot of software to write for the XE (or whatever machine you actually work at). Much of your applications will probably choke on it. It's not practical.

A better solution would be the Gumby upgrade for the 800XL. That would give you a second SIO port on the XL. Then you'd link the XE to XL via the new SIO, and XL to devices via the old SIO on the XL. You'd still have a bunch of tricky driver software to write in assembly language, but at least it would sit on the XL where it doesn't break the applications. The XL could be a smart disk cache with staged writes, printer buffer, or whatever you're willing to program.

Message-ID: <9208082001.AA02228@brachot.jct.ac.il>
Source record: 110037

In 1986 Analog magazines, I read about Atari promising some kind of 520 XE,
with 512K RAM, 80-columns, built-in 3 1/2 inch disk drive, PBI interface,
some kind of GEM mouse interface for the 8-bits, etc. etc...
What ever came of it? Apparently nothing - but does anyone know about it??
Why it never happened?

I have two double-sided 360K IBM drives, from an old XT that I was allowed
to do anything I want with...
Is there any way to connect it with an Atari? Which computer do I need?
I currently have an 800 and 1200XL (although I rarely use the XL - would
prefer a conection with 800..)
Anyway, how would such a connection perform? Will I have access to the full
capabilities of the drive (DD-DS)=360K?? Will it be able to A) read my current
disks and B) Work with MyDOS (if not, which DOS?)??
I'll be glad for any help (please E-mail direct to me..) Thanx!!

I've recently acquired the Hitchhiker's guide to the Galaxy..
I've noticed it takes up 2disks. Is there anyway to remove the annoyance
of switching disks every once in a while? Like, using a double-density
disk? Hellllppppp!!!

In a previous article, bruck@BRACHOT.JCT.AC.IL (Itay Chamie1) says:

>I've recently acquired the Hitchhiker's guide to the Galaxy..
>I've noticed it takes up 2disks. Is there anyway to remove the annoyance
>of switching disks every once in a while? Like, using a double-density
>disk? Hellllppppp!!!

I bought Hitchhiker's Guide a long time ago, maybe 1988 or so, but the one
I have is on a single disk, just both sides... But you only need the front
to boot, then just flip it over, and you never have to worry about it after
you start playing! I'm not sure what you mean by having to switch disks??

3248. Percom controller wanted

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-09 10:35:07 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9208091037.AA14056@brachot.jct.ac.il>
Source record: 110044

Hi there, I was wondering how much would a Percom controller cost.
I want: It's power supply (optional - if you fried yours, just tell me the
output power specs)
It's case (optional - if you don't have one I'll still buy)
It's main circuit board (without the drive mechs themselves.)
If yo have any for sale, contact me.

I have 2 IBM compatible drives I want to connect to one.
BTW, what connections does the controller expect to find on the IBM drives?
(just checking if they're really compatible.) My IBM drives have a 4-pin
power connector and a 17-bit data bus. Is this what Percom looks for?

3249. Classic Atari Cartridges v.2.1

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-09 15:53:47 UTC
From: chase@electron.rutgers.edu
Message-ID: <Aug.9.11.53.46.1992.26917@electron.rutgers.edu>
Source record: 109921

Thanks to a deluge of new mail, this list has passed the 300 cartridge mark. Hurray! Keep 'em coming. Periodic repostings of this list will continue so long as I continue to receive enough new material to warrant it. I would now be very interested in cartridges available in other countries but not in the US (I think this might plug some of the holes in the Atari corp. section). Any one out there in the know?

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 2.1

I am trying to compile a list of all cartridges released for the Atari 8-bit computers. I am organizing the list by catalog number as listed on the outside of the cartridge, when available, and by manufacturer. A year column holds the copyright date and/or release date of the cartridge.

Some of the list has been distilled from old magazine ads and reviews, and may be subject to errors. Entries with question marks after them may not exist in cartridge form, or worse, may not have been released at all.

I'd would like help completing this list. Comments, additions, and words of encouragement are all appreciated, and will be noted in the contribrutors list at the end of this post.

Kevin Chase <chase@physics.rutgers.edu>

>--
> Michael Current, Cleveland Free-Net 8-bit Atari SIGOp -->> go atari <<--

Yeah, I thought of that as well but.... The machine would not have been shown until the OS was (mostly) complete. Since hardware is almost always designed before the OS is written, the actual Atari 400/800 could have easily existed in 1977. There really wouldn't be a need for an OS if they wanted to Hard Code all of their graphics.

Just a thought.....

> Internet: currentm@carleton.edu / UUCP: ...!umn-cs!ccnfld!currentm
> BITNET: currentm%carleton.edu@{interbit} / Cleveland Free-Net: aa700

Yes, mjl's mailer is screwy, but only for not taking UUCP sites into
consideration. If Edinboro was (will be soon though) a full Internet
site there would not be a problem. Edinboro is, however, only a UUCP
site that uses Pitt to receive Internet mail. (Mail is transferred via UUCP
from Pitt to Edinboro). Edinboro.edu is indeed a perfectly valid UUCP
node/domain. The problem seems to be with the software.

>Adam,
> Could you give me the IP address of your computer system host or
>any alternative Email schemes? Are on any other UNIX/Internet systems?

We have no IP address (yet!) for the above reasons.
The only other network I (rarely) use is Compuserve (I can't even remember
my own account # off hand).
If you have access to Fidonet, I can get you the node number for the SAGE bbs
which is local to me.

> markjl@pub2.bu.edu <=- is my account on the pub2 system, at Boston

3254. TV games: Atari 2600, Intellivision, Odyssey2 for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-09 20:27:16 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0095ED89.09D2CC40@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 110047
Cross-posted to: comp.sys.atari.8bit,misc.forsale,rec.games.video

I am selling off my old collection of TV video games.
Here is a list-
Atari 2600-
Base unit (traditional design)
Another base unit (the more recent design, smaller Jr. version)
Atari 2600 dust cover (with the Atari logo on it)
Atari joysticks
Atari paddles
Atari keyboard controllers
Atari keyboard controller pair (a pair coming from one plug)
Sears joystick/paddle combination in one unit
High-quality joysticks (better response and handling than the Atari ones).
Rapid-Fire thingy that comes between the Atari main unit and the joystick
Game cartridges-
Air-Sea battle
Brain Storming (activision)
Astroid
Super Breakout
Defender
Pole Position
Football (cx-2625)
Missile Command
Space invaders
Homerun
Star Voyager (Imagic)
Video Pinball
Target Fun
Pele's Soccer
Pac Man
Volleyball
Decathlon (Activision)
E.T.

Intellivision (by Mattel)-main unit with 2 attached controllers
Games-
Donkey Kong
Space Armada
Space Battle
Star Strike

Magnavox Odyssey2 - main unit with 2 attached joysticks
Games-
Blockout/Breakdown (kind of Breakout game as I recall)
K.C.'s Krazy Chase (a Pac-Man clone as I recall)

Prices-
Really looking for offers. For those who hate to see items post without prices, I will say that something in the range of $10 for Atari 2600 base unit, $20 for the complete Intellivision with games, $17.50 for the Odyssey with games, are in the right range. But all offers will be considered, no matter how low -- or how high!
Please make offers on any of the items, including individual games or base units or accessories.
Please e-mail to me at COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804)293-8973 nights.
Thanks.

3255. Re: A new perspective on 8bit piracy.

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-09 21:39:06 UTC

Source record: 110048

To the best of my knowledge, I believe that if you have actually --PURCHASED--
a copy of ATARI 8-BIT software, then you have bought a liscense to use that
software (or in the case of older copyright agreements you may actually own
the software, outright). The United States of America's federal
copyright law allows you to create archival backup copies of software for
your personal use provided that you have purchased a copyright liscense to
use the software by purchasing the original software. If you have puchased
a copy of M.U.L.E. to use, it is my understanding that current federal
copyright law allows you to ethically make as many copies for your personal
use as you would want, provided you had purchased a legitimate copy.
It is my understanding that USA federal copyright law limits how you may
"USE" such software (a site liscense, a single user liscense, etc.), but
not how you would "STORE" such software, including making archival backups.

This information on the current state of USA federal copyright law comes to
you courtesy of the last few issues of "ST REPORT" online E-Magazine.

>Just a thought.....

I think your assumption may be wrong--the Atari OS wasn't written on a prototype Atari, it was written on [this was discussed earlier, it was either an Apple II or a PDP-11]. With this in mind, it seems unlikely that the hardware was available much before the software. Prototypes would not have existed two years before the first release. Furthermore, I doubt that Atari would have released a prototype to an outside business before it was released--secrecy is important to stop the competitors from stealing your developments.

3258. 1200 XL hack

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-10 10:18:34 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9208101020.AA26755@brachot.jct.ac.il>
Source record: 110052

I've finally decided that I don't use my 1200-xl anyway, so I might as
well hack into it and jazz it up..
The first thing I want to do is improve its video. The ONLY reason I
still like the 800 is that it has the best display, and thus, the most
readable with 80-columns I'm using right now.
If anybody knows ways to make the video as good as the 800 or better -
email me.. thanx! :-)

3259. Percomm/Trak drives

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-10 13:22:00 UTC
From: bbs@neb
Message-ID: <1992Aug10.132200.23318@neb>
Source record: 109909

I just recently acquired a Percomm and a Trak disk drive. Both have
'slave' attachments, and in fact - I have a double density 180k slave
drive attached to the Trak. (Its an AT-D10 model Trak).
.
My question is, how do I go about adding a 360k IBM drive mech as a
slave to these drives (Percomm and Trak)? Is any modification necessary?
I already tried to take a standard 360k drive (plugged into my IBM's
power supply) and hooked the cable from the Trak to the IBM drive and
attempted a format using SpartaDos (80 tracks by DD), but it just
errored out.
.
Any suggestions greatly appreciated.
.

From: indy@IMMACC.PREPNET.COM
Message-ID: <9208101525.AA14942@ucbvax.Berkeley.EDU>
Source record: 110053

About a year ago, I bought a great adventure game, Silicon Dreams, by Firebird software. I played the first of the triad until I couldn't see straight anymore. I finally gave up when I could not figure out how to get by the "waldroid" near "Jacob's Ladder."

I recently gave it another shot, but I'm still stymied. Can anyone give me a hint? Also, where are the "dark glasses" for welding? Please email, so as not to spoil it for others. Thanks.

I've found that I have the opposite problem: My 800 is rather fuzzy
while my 800XL is nice and crisp. My 800 is from back in 1982--no GTIA
chip.

So how is this sort of thing fixed?

You can see it today if you download NASTY.ARC from the atari.archive 8bit section. You need to build a little interface though. It uses the serial and the parallel port, but you still can use your discdrives. Only works with the ST.

Guess who made it...

3264. Re: Percom controller wanted

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-10 21:40:50 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1992Aug10.214050.5094@news.ysu.edu>
Source record: 109908

OK Itay....I just got though all that and I found out that that
article in zmag206 is in error when it says you can run IBM 360k
drives on an atari with a PERCOM interface from a controller
drive.
To make a long story short, I hooked it all up to a 720k ibm 3 1/2"
drive and 5 1/4" Ibm 1.2meg...also 360k drive...heres what happened:
5 1/4" 1.2meg drive would not format at any density, But the 3 1/2"
drives formatted on one side...the docs to the percom say that it
does 40 and 80 track drives but it does not say if it will do DS.
I found out it doesnot. When you format it in Sparta X it lies to
you ...says it formatted both sides but the sector count is in
error....I tried to fill the disk up and I had a "nonexistent
device error" at aprox. 180k.
The guys on Genie last Thursday night said to get XF551 and do it
if you want 720k disks but the PERCOM was a bust...at least I don't
know how to write a new EPROM for it to do double sided high speed
....oh ya....the thing was slow as it was in 1982.

3265. Atari ST - 1meg, color, 85meg HD - $600

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 02:42:52 UTC
From: epkst1@pitt.edu
Message-ID: <4581@blue.cis.pitt.edu.UUCP>
Source record: 109910
Cross-posted to: misc.forsale.computers,comp.sys.atari.8bit

I have the following ST system for sale:

I'll pay 1/2 of the shipping, and I will take $600 for the entire system.

Reach me at:
kuzemcha@tartan.com
or epkst1@unix.cis.pitt.edu

(all prices in US Dollars)

520STM 150
1 meg, TOS 1.4, RF modulator

SC1224 color monitor 100

85 meg HD, dual floppy 350
This is a Seagate 296N SCSI drive
with a ICD host adapter (with clock).

HD, host adapter and two DS Fujitsu
floppy drives are in a 3-bay gray
shoebox case with its own 150 watt
power supply. Really nice setup.
I'll leave all the PD stuff I have on
the disk. (10+ meg).

Single-sided ST floppy drive 15
Older than the rest of the stuff,
but still works.

Software:

Mark Williams C and CSD v3.0.5 30
WordUp v3.0 15
DevPac ST v2.0 assembler 10
NeoDesk v3.0 10
Forth MT (Abacus) 10
Degas Elite v3.01 10
ProCopy 10
G+Plus 10

3266. For Sale/Trade: Atari 2600/7800 Games and Systems

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 06:04:26 UTC
From: drudetb@infonode.ingr.com
Message-ID: <1992Aug11.060426.5128@infonode.ingr.com>
Source record: 109911
Cross-posted to: rec.games.video,misc.forsale,comp.sys.atari.8bit

For Sale or Trade: Atari 2600/7800 Games (New)

I am willing to trade the Atari 2600/7800 games listed below for other Atari 2600/5200/7800/400/800 cartridge games. All of these games listed below are new in boxes with instructions. Most are still shrink wrapped. Send a list of games you have to trade if you're interested.

In addition to trading games, I am willing to sell the games I have on hand at the prices listed. Prices on new games includes shipping in the U.S. When the quantitly of games I have on hand are gone, I will still be willing to get some of the games listed, but the purchase price will go up to $10, which more accurately reflects my costs.

New 2600 Games:
==========
$6 each:
Codebreaker Circus Atari Midnight Magic RS Soccer

$8 each:
Sentinel Off the Wall Stargate Yar's Revenge

Other titles availabe for $10 each:
Asteroids Battlezone Centipede Crystal Castles
Dig-Dug Desert Falcon Double Dunk Galaxian
Gravitar Jungle Hunt Joust Jr. Pac-Man
Kangaroo Ms.Pac-Man Moon Patrol Mouse Trap
Pole Position Solaris Q*bert RS Football
RS Tennis RS Baseball RS Volleyball Secret Quest
Sprint Master Space Invaders Super Breakout Super Football
Venture

New 7800 Games:
==========
$6 each:
Choplifter Super-Huey UH-1X

$7 each:
Asteroids Barnyard Blaster Ballblazer Centipede
Crack'ed DigDug Joust Impossible Mission
TD Football Pole Position II Hat Trick Fight Night

$8 each:
Ace of Aces Commando Donkey Kong Donkey Kong Jr.
Fight Night Robotron 2084 Tower Toppler

Other titles available for $10 each:
Asteroids Karateka 1on1 Basketball
Pole Position 2 RS Baseball Robotron 2084 Xevious

Trade information:
==========
2600: Mainly looking for rare and semi-rare games. I have most of the common Atari-label games, but I'm still looking for a few titles so send me your list. Semi-rare titles that I'm especially looking for include any of the Sesame Street games and Lost Luggage. If you have a common game that I want, and it's in good shape with instructions, I will trade even-up, new for used. If you have an unusually rare game that's worth a lot of money, we can probably work out multiple games and/or cash in exchange.

5200: Still looking for many common 5200 games, so please send me your list.

7800: I have most of the Atari label 7800 games, but I will trade for several of the rarer ones (Marios Bros., Desert Falcon, Xenophobe, Motorodeo, etc.) and any Absolute title (except F-18, I already have two copies).

400/800: I am also interested in most Atari 400/800 carts (but not XL/XE-only) and some disk or cassette-based games. Disks must be originals with instructions.

7800/2600 systems:
==========
- Atari 7800 system. Includes console, AC power supply, two controllers, TV switch and cable, and owner's manual. Comes bundled with five games: Pole Position II, Ms. PacMan, Xevious, Galaga, and Robotron 2084. Everything is in original packaging with warranty cards. $50 plus shipping.
(Will also consider trading for a clean working 1050 with US doubler upgrade.)

- Atari 2600 VCS system. Includes four switch (2600A) model console, AC power supply, two Atari joysticks, one Atari paddle controller, TV switch, and Combat game cartridge. Excellent cosmetic condition. $25 plus shipping.
(Will consider trading for a 1050 or an 810 in good working condition.)

- Sears Tele-Games Video Arcade. Identical to the system above, except labeled for Sears by Atari. Also includes owners's manual. $25 plus shipping.

- Atari 2600 console only. In good working order. $10 plus shipping.

Used 2600 Games:
==========
Condition: working fine, but no docs, no box.
May have some cosmetic defects (torn label, etc.)
Price $3 each, plus shipping.

Atari:
Combat Casino

Defender Breakout
Pac-Man E.T.
Ms. Pac-Man Warlords

Coleco:
Donkey Kong

Activision:
Decathlon Skiing

Imagic:
Atlantis

Parker Bros.:
Q*Bert

Terms:
======
I am willing to take cash, check, or money order for any of the above stuff. If you me send cash or postal money order, I will ship everything ASAP, usually by the next day. COD's are also fine, as long as you're willing to pay the extra charge.

3267. Math Progs for the 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 08:35:55 UTC
From: un035513@wvnvms.wvnet.edu
Message-ID: <1992Aug11.022453.3433@wvnvms.wvnet.edu>
Source record: 109912

Does anyone know of a program (or group of programs) that can perform abstract mathematical computations: i.e. intergration, diff'ion, polynomial factoring/expanding, etc. Something like derive on the IBM. If not, does anyone know were I can get hold of some articals explaning the algol's for programming such a beast. I hate having to go to the lab to work on Derive and Mathematica (hey, how 'bout Mathematica on the old 8-bit, hahahahahaha).
Thanx in advance.

3268. Sparta Dos Question

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 12:41:28 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <13279@chalmers.se>
Source record: 109913

How come some programs that runs under Atari Dos dont
run under Sparta Dos?
Do You have to alter the run Adress?
I was trying to make A greatest Game Disk with some progs around my disks.
The diskettes was pretty old so I figured it was best to rewrite
the files on another disk for safety purposes.
the files I tried included Pooyan and Juice...
Juice would load normally, but Pooyan an alot of other games would just
hang up....
Whe I used Putrun all showed up to have Run address 0040..
Why I wish to Use sparta Dos is for Ultra Speed purposes..

Thanks.

I am looking for the Atari technical manuals for the Atari 800xl, 130xe, 850 Interface and Sx-212 modems. I am also interested in acquiring any technical reference manuals for ANYTHING atari 8 bit related. Looks like the only local person here (in Utah) that performs decent 8 bit repair work has a case of ego-mania and now is charging unbelievable repair rates (as he has us by the genitlles so to speak). I would like any reference material that will assist me in peforming my own diagnostics and repair work. Specifically, I am also interested in acquiring software that will aid me in re-aligning disk drives (1050, Indus, Rana, etc..) or any SOFTWARE for diagnostics on the 8 bit..

3270. Monitors, monitors

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 14:08:41 UTC
From: chase@electron.rutgers.edu
Message-ID: <Aug.11.10.08.40.1992.11278@electron.rutgers.edu>
Source record: 109931

I just finished testing this refurbished monitor I bought for use with an IBM clone. It can handle MDA and CGA inputs into a DB-9 plug. The question is how do I go about hooking my 130xe to this? The CGA RGB pinouts include RGB, Intensity and two pins for horizontal and vertical drive. I understand that the composite signal coming out of the Atari is serially encoded with this information. Is the circuit for decoding this simple enough, or a common part I can get somewhere. I have several composite monitors, so I can manage without this, but I'd like to keep the clutter in my office down to a minimum. In other words, I don't have room for one more monitor and need to get double duty from this monitor. Any help would be appreciated.

3271. IBM 360K Drive Mechs/Percom Controllers

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 14:28:14 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9208111428.AA29360@smithkline.com>
Source record: 109923

I noticed the posts by J. King & I. Chamiel on the subject of Percom controllers vs. IBM 360K mechs & thought I'd add the Alchemist's $.02 (I've done a lot of experimenting in this area).

First- to Itay- the power supply & contol electronics of all Percoms are all integrated into one <large> board; there aren'T separate cards for the PS.

Jim King creates a somewhat misleading impression about things because he failed to state which model Percom he used. There were at least 4 or 5 different models. Some were SD, some were SD+slave, there was one that included a built-in parallel printer port (!), then there were DS/DD single & double mech models. Please, people, whenever you discuss ANY hardware trials you have done, you MUST state exactly which hardware you used, otherwise whatever you say has no meaningful context. (BTW, I'm not at all certain the list of Percom model variations mentioned above is ALL of them. Furthermore, there were numerous hardware/firmware variations evern among the same model; I swear I don't think Percom ever built the same drive twice. And virtually all of them had serious thermal problems, especially the stupid way they mounted regulators.)

It is also a good idea whenever possible to say exactly which brand/model drive mech you used. To my recollection Percom used mostly MPI & Tandon full-height mechs, although half-height mechs were installed in later production models especially the double-sided ones.

The drive/controller connection is indeed the standard Shugart floppy interface (34-pin connector) which is what the std. IBMs use (as far as I'm aware).

I've experimented mostly with the AT88-SPD (if my memory serves correctly) & was able to format old-style full-height Tandon mechs in 360K (REV 1.21 firmware). Also various half-height mechs: Panasonic, Toshiba, & several others I forget. These mechs were quite variable in age, from 10 years old to very recent (1991) production. They all worked. I used Sparta 3.2D. I seem to recall problems trying to format them w/Ultraspeed, I don't think it worked. You could do DS/DD but access was kinda slow. (I did all this a couple years ago, I just wanted to see if these things would work, regrettably it was all just dabbling not a systematic investigation, now made hazy by the passage of time.)

Here's an interesting little war story: one morning on my way to work a few years ago, I was surprised to spot what appeared to be a computer terminal lying to the side of the Schuylkill Expressway. After I got to work I told my boss what I had seen & asked if would be OK to take a few moments to quick drive back there & retrieve the thing before someone else stppoed & scooped it up. He said OK. (My boss is a cool dude: I'm talking about a guy with a Ph.D. in marine natural product chemistry who once crawled into a garbage dumpster to bring me a 2600 his neighbor had trashed.) Anyways when I got back there

what I found was a Radio Shack Trash-80 II (48K RAM). This thing had apparently fallen from a car at high speed & bounced for 300 feet down the highway. The keyboard was completely gone & there was a trail of loose keys for 200 feet scattered all over the road. The video screen looked OK from the front but inside was a mess of broken glass. There were 2 full-height single-sisded Tandon drive mechs in there, mounted to a metal bracket. The bracket was twisted junk, but incredibly the 2 drive mechs still worked with a Percom controller. Same model Tandons Percom used. Those suckers could take a beating!

NOTA BENE: All posts asking if I will sell my Percom stuff will be ignored.

3272. Re: 800XL as a server

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-11 14:47:05 UTC
From: van@buengf.bu.edu
Message-ID: <93349@bu.edu>
Source record: 109914

A few days ago, I was thinking of using the 800XL as spool to speed up
the diskdrive and printer but now it seems harder than I'd thought.
As I said before, I planned to keep the XE the same (both software and
hardware) so it would work with all the software I have. I have to make
some change on the 800XL though. For the hardware, I don't think it is
going to be that hard. I know that the SIO uses only 3 (or 4) lines to
send and to receive data and the signals are TTL so the joystick port
should be able to handle that. The hard part would be writing software.
The 800XL has to manually rise or low the correct line of the joystick.
It also has to understand the SIO commands (read or write, disk or printer...)
and respond to that command.
I also don't know how the "system" would boot up. Maybe I would turn on
the disk first, then the 800XL boot up and run a program (now it would act
like a disk) then I would turn on the XE and it would boot up from the 800XL.
This set up would speed up the time to save or print a file (slow down actually
since it has to go through the 800XL first, but I would be able to work on
something else while the saving or printing is going on). It also has the
negative side though. It would take longer to load up a file (go through
the 800XL first). If something went wrong inside the 800XL (there is no way I
can tell), I would lost data.
Unless I do alot of work, I don't know if it's worth it.

Van

3273. Re: Percomm/Trak drives

360k=> 40 tracks DS. If you happen to come across an old IBM Quad density drive, you may want to try that with the controllers you have. The numbers are <?> Teac FD-55B (NOT FD-55BV- ANYTHING ELSE!), FD-55F-03-U, FD-55-01-U, & I think the Mitsubishi 3585. The Teacs will have either a resistor @ R14 or a missing one. By putting a switch with the resistor you can convert from Quad to /double density. The Mitsubishi's don't appear to have the option. What I think happened was Teac only made quad drives for a while & depending on the resistor sold them for 360 or 720k drives. A LOT of places aren't awre (parts surplus) of the fact these are quad drives so they put them in the broken bin for $5. I've used these drives with a modified XF551 board. Whoops! FD-55-01-U=>FD-55B-01-U & the 3585 could be 3855, you'll have to 2x.

3274. 1200XL Hack

Source record: 109929

Preston,

Places like B&C Computervisions and American TV should have GTIA
upgrade kits for the 800, give them a call and ask.

Itay,

I will dig up some back issues of SLCC Journal and see if I can't find
the 1200XL video upgrade documentation. Bob Woolley mentioned the
main problem with doing the video upgrade is that it is difficult
to impedence match both the composite video output and the separate
luma chroma outputs at the same time. I believe Ben's Super Video
upgrade for the 800XL avoids this by having a switch you set for
one of the two outputs, but it never impedence matches both sets of
outputs at the same time. Perhaps a letter to Bob Woolley or some
email to him on Compuserve will convince him to sit down and
modify his upgrade. Anybody got his CI$ Address?

Message-ID: <9208111657.AA12803@nettlerash.berkeley.edu>
Source record: 109930

Besides the Zucchinni (spelling? Oh well) there are two other devices
that were made to connect one set of hardware devices to
several Atari computers. One was the MPP Micronet, reviewed by
Matt Ratcliff in one of the glossies a couple years back. It
plugged into the SIO ports, and used a modified version of DOS 2.5.
There were problems though, if two people opened files on the same
drive, the first person pointed to a sector, and then the second
person inadvertantly wrote some data, the disk would get scrambled.
I believe the operative problem is called Bus Contention.

The second device is called the Multiplexor from CSS. It plugs in
to the cartridge ports, and also uses either a modified version
of MYDOS or Spartados 3.2d. It won't work with SD-X.
I haven't really read any reviews on this thing, but supposedly
CSS's multiline BBS is run on several 8 bits connected via the
multiplexor and using Bob Puff's own custom BBS program, that allows
the 8 bits to communicate to each other, as well as share files,
thus allowing conferencing on the BBS and stuff.

What you could do is set up the host and have it run a RAMDISK and
print spooler program. Then the guest computers would save their
files to the RAMDISK, and printer output would be spooled.
This might solve your problem of your 1050 pooping out on you, and
having to wait for your printer to print.

Source record: 109916

From article <9207272152.AA21721@smithkline.com>, by poehland%phvax.dnet@SMITHKLINE.COM:
>
> In the past couple issues of this Digest several people have expressed quasi-
> legal opinions on the legality of copying abandoned software. Judging by the
> contradictory nature of those opinions, the legal issues are just as murky as
> the moral ones.

Actually, I don't think the legal issue is a murky one. Someone, either an
author or software company (even if defunct) holds the copyright to every
piece of software. That person or entity has to relinquish the rights to
that software before it can be considered public domain. It is not something
that can happen by default (until the copyright runs out).

Having said that, I sympathize with everyone still trying to use an
orphan machine. I was going through my boxes of atari 8bit disks a
while back trying to organize and reduce what I had. I ended up dumping
a lot of disks of PD and pirated games that I never use and kept only
the commercial software that I have all the original dox and boxes, etc
for. It hurt a bit because I knew I could never replace some of them
even if I wanted to. But the truth is I will probably NEVER buy another
piece of software for my 8bit Atari. I rarely even use the software I
have now and I have too many other things crying for my time and money.

What hurts the most I think is the fact that there isn't the close
friendship between owners of other brands of computers. I belong to
a PC users group also, but they view their machines more as appliances
and other users as just another acquaintance and little more.

Keep the faith...

The controller of the Percom is only able to format 1 side or the
disk....I was able to format in 737k sparta dd/ds mode and the thing
lie to me...said there were 2880 sectors but there were 1440 and the
360k said 1440sec. but it only formatted on one side...I know cuz
I used an old disk formatted on a 1050 and the old data was still
there after I formatted it on the IBM using a Percom controller.
I used just about every config ibm has...5 1/4 and 3 1/2 360k to
1.44meg drives. The 360ks worked best but all were sssllllooowww!
cuz of the controller...thats 1982 technology.

If you're using Sparta3.2d then some programs will not run cuz
of memory conflicts with the dos (such as turbobasic programs).
But Sparta X cart does away with the problem by having the
ability to relocate the dos automatically...all you got to do is
tell the config.sys file to put sparta in banked memory. ie:
USE BANKED
DEVICE SPARTA BANKED
(etc)

Somebody a ways back mentioned using the SIO ports to connect several Ataris together for an interactive game. Well that is exactly what AGDA (the Atari Game Developer's Arena) is developing. AGDA is Chuck Steinman, Jeff Casbeer, myself and others, and our premier game is nearing completion. It is reminiscent of "Midi Maze", with some tactical changes put in for the sake of uniqueness. Up to eight Ataris (600/800/1200/XL/XE) can be connected either with standard serial cables to a box with eight SIO connectors, or all together with one 'octopus' of a cable. Only one copy of the game software is needed, as the other Ataris "boot" from the Host (which I guess you could call a server). The game gives you a first-person view of a three-dimensional maze where you can see the other players wandering around, taking shots at you. Graphics are in full-color, use horizontal scrolling and GTIA mode for extra colors. Sounds will be provided to give you feedback on your motion and warning you of incoming fire.

I'll keep you up to date on our progress...

Kit,

You state that an author or software company has to relinquish rights
to a program before it can be considered public domain. This is not
true. PD simply means not for sale, not uncopyrighted/owned as you
suggest. PD software can be copyrighted by any author or software house.
PD software s public, ie anyone has access to it.

3283. 800 memory upgrades, .PIC file viewer

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-12 01:48:38 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.713584118@pv1788.vincent.iastate.edu>
Source record: 109928

just got myself a couple of old 800's, and took a
look at the addmema.arc file from the archive.
Is there a program on the archive that will let me
view the .PIC files? I know next to nothing about
the graphics file formats for the 8bit, if anyone
out there is an expert on this, I like to know
more.

As for the memory upgrade on an 800, is the hack from
the archive compatible with most software? Are there
better do-it-yourself upgrades out there?

Todd

Source record: 109924

I might have something here I got from GEnie, let me look it up later and get back to the net about it. I think the most difficult part of writing something like that would be the equation evaluation part, taking a STRING and taking it apart piece by piece to try to transform it into a set of procedures the program takes to evaulate, differentiate, or integrate the original equation. Graphing, plotting, or other display of the data would be a must for such a program as well. Anyone up to the task, I think this ranks up there along with a schematic program and a beefier 80 column word processor.

Message-ID: <9208120120.AA20388@nettlerash.berkeley.edu>
Source record: 109926

Fredrik.,

It could be several things. Have you tried using SpartaMENU?
It came with the contruction set.

If you are using the regular SpartaDOS, try KEYOFF and XDIV before
running the program, also make sure you haven't run any other
TSR programs, like TDLINE or RAMDISK, or other driver programs
that latch into memory.

The other problem if you are running straight from the DOS command
prompt is that there is no RUN address header appended to the program.
I found out this when trying to use a Mouse handler written for Atari
DOS on SpartaX. If AtariDOS doesn't see a RUN address vector
once the file is finished loading, it returns to DOS, but Sparta
instead tries to RUN at the load address of the OBJECT file.
To keep my mouse handler from crashing I had to append a RUN vector
at the end of my OBJ file that simply pointed to an RTS in the
object file itself. You have to disassemble the program usually in
order to do this. Have I lost you? Well I don't think this is your
problem as it more often happens with Terminate and Stay Resident
(TSR) programs, and not games and stuff.

You're right, Michael, it doesn't compute. In particular, I'm fairly sure that Lucas did NOT use 8-bit Atari computers (unavailable in the mid-70's) to produce any graphics for Star Wars. I was told by some co-workers (in the mid 80's) that a program called GRASS (running on some sort of mainframe, can't recall what) was used to produce the graphics for the Rebel pilots' briefing prior to the attack on the Death Star. There may have been other programs used as well.

Perhaps the "8-bits used for Star Wars" story originated with the development of games by the LucasFilm Games group for the Atari 8-bits. The developers programmed the games first for the Atari 800 computer. I know this because I attended a "seminar"/demo given by one or two of the people from LucasFilm Games, back in '85 (may have been '86, but I know it was between 5/85 and 4/86 because the company I worked for then sponsored the seminar - one of their "employees" [who rarely did much useful work] knew the LucasFilm Games folks through his father. Tee Hee - I got to see the "jumping Jaggie" trick in Rescue on Fractalus before ever playing the game! BTW, these guys used a separate, larger (DEC? IBM? ?) system to cross-assemble/compile their code. And they knew all the major nifty techniques of programming 8-bit graphics (that I have read about many times but never tried :^/). Also, they were clever. I recall them saying that the landscape in Fractalus is generated from a 100 x 100 matrix of numbers.....

Source record: 109933

I just recently got an atari 800 and 2 1050 drives, and I need a lot of help!
I never had an atari computer, but when I was growing up I always wanted one so
I just recently finally got it.
my problem is that the machine I got is used and the previous owner did not
have the manuals or anything, so I am quite lost.
first, which connection goes from the first drive into the computer andthen
which one goes from the first to the second drive, I keep getting the
scroling "boot error" message.
also how I get out of the memory pad into something that I can work with
or for the same matter, how can I make the machine read my drives?
If anybody is willing to sell me/photocopy or referme to someone that has
any type of documentation/books/proggraming aids I will really appreciate it.

thanks in advance

From: tatmanl@terapin.com
Message-ID: <tatmanl.13xe@terapin.com>
Source record: 109943

Does anyone have their 8bit hooked up to a laser printer. I have an HPIIIP and sometimes it would be easier to hook it up to the 8bit. Are there any drivers out there for the HP? Id like to use it with Atari Writer or Text Pro. I tried writing my own driver for Atari Writer, but no luck.
Any input would be helpful at this point.

> Pattie Rayl (Atari Interface)

As I understand it, that is not correct. "Public domain" is a legal
term meaning not copyrighted. Shareware is typically copyrighted, but
can be freely copied by anyone even though it is not public domain.

Source record: 109934
Cross-posted to: rec.games.video,comp.sys.atari.8bit

First, is there a FAQ anywhere that lists all of the cartridges for the 2600?

I'm looking for the following:

BASIC
Pitfall 2
Towering Inferno
Star Ship
Freeway
Kaboom

Also, I am interested in the keyboard and race controllers.

Please send me email if you have any of the above (or any rare 2600 stuff) and you are willing to sell it.

To put it mildly, this is incorrect.

Public Domain and Copyrighted are mutually exclusive; a piece of software cannot be both at the same time. When I, as an author, create a piece of software, I alutmatically have a copyright on my work. I can choose to relinquish that copyright and release my work into the public domain, at which point I no longer have the copyright. In fact, no one does; that's what public domain MEANS.

I've noticed a misuse of the term in a lot of shareware/freeware type releases. The author will place a copyright statement in the documentation, and then in the next sentence say "this program is public domain." What he REALLY means is that the software is FREELY AVAILABLE; no price can be charged for the software, but the author still retains the copyright. This is done primarily to prevent other people from selling the software and earning profits from the author's work. You see, if a work is public domain, I can do ANYTHING I WANT with it. I can sell it, modify it, use it as the basis for another program, whatever. If the original author holds the copyright, even if he doesn't cahrge me any money to use his program, I am prevented from selling it, modifying it, or producing a derivative work from it WITHOUT THE AUTHOR'S EXPLICIT PERMISSION.

Do you see the difference?

You need to have a cartridge inserted to get something other then 'memo pad'
If you can't find anyone locally, people that handle still handle Atari will
sell you REV A BASIC for about $5. If you get really desperate, I've got a
couple of REV C BASIC carts. You need to have a disk in the drive with DOS
on it to boot properly. If that isn't the problem, it could be the drives are
both set to respond as drive #1. Just check the switches in the back & make
sure they aren't in the same position(s). It doesn't matter what comes 1st
in the chain for the serial bus.

3297. Question -- Atari 800 lost color -- How to fix?

Newsgroup: comp.sys.atari.8bit

From: jonathan@CAD.UCLA.EDU
Message-ID: <7833@lee.SEAS.UCLA.EDU>
Source record: 109946

Hi,
I hope this isnt a common question, but, my Atari 800 recently lost the
ability to produce color (perhaps only red(?)). This failing occurs on
both the "ch 3" and "ch 2" output as well as out of the NTSC(?) port
on the side (the 5 pin din).

1) Is this a common problem?
2) Is there a fix that I could do?
3) If no to 2, where does one take 800's to be fixed and is it worth it
over buying another used.

Thanks for the help,
Jonathan

Or you could let BASIC do it for you, and the program becomes trivial.
About 5 years ago my son was learning to graph, so I wrote such a program
that finds mins, max, differentiates, finds mins & max of the
differential, and plots the equation. I haven't done anything with the
Atari in over 3 years, so I do not know if I still have this. If I find
it, I will post the program.

Sounds fascinating!!

One minor suggestion, if 'twouldn't be too hard to implement: Howzabout the possibility of modem play? (This seems to be a growing trend in ST games, BTW.) Since you're doing entirely SIO communications, you wouldn't (probably) need an R: handler. Would it be possible to incorporate this? (I don't have any local 8-bits; not local enough to connect directly, anyway.)

The order in which the drives are connected (daisy chain) doesn't matter.
But it sounds to me like you have a drive ID conflict; either both of the
drives are set to the same number, or neither is set to #1. Check the drive
selector switches on both units (in back, inside a small [round?] hole).

The newest version I know about is 4.53/3. The /3 simply means that the
FREE SECTORS count is only 3 digits instead of 4. This allows better
compatibility with software that illegally checks for the end of directory.
Most of the improvements from 4.50 to 4.53 seemed to be cosmetic but there
were also improvements in RAM/drive configuration and you could chain
AUTORUN files. It has been a while since I have seriously used MyDOS though.

I use SDX almost exclusively now, but MyDOS 4.53 is definitely my second choice,
with SpartaDOS 3.2 being 3rd (and AtariDOS being a distant last :). I have
just acquired a second hard-drive so I am going to attempt to format a
partition in MyDOS (bootable). It should be interesting.

I will attempt to upload this to the archives but it is rather trickey without
FTP. But... We just got new software on our system that *should*
automatically UUencode. I'll have to give it a try....

3304. Quick... ARGH!

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-13 01:11:08 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <0s8ePB3w164w@cyberden.uucp>
Source record: 109949

Marek Tomczyk was a generous soul and purchased a copy of Quick from Power Per Post for me and mailed it out to me. (He must've decided to do this before I mentioned that I finally came in contact with them. (next time I'm REMEMBER TO USE AIRMAIL! ARGH!!!)) Anyways- I returned from vacation to see the pile of mail sitting on the sofa, and the only one to me being this gem of a program. Or so I thought...

Marek explained that when booted, the Quick disk will show a shell screen that prompts me to "Edit, Compile, or DOS". This is true. He said that pressing one of the keys (E,C or D) will do what is supposed to happen. This is not. Now...I'm sure this can be one of many things. Marek mentioned the possibility of PAL vs NTSC incompatibility. It may be. Of course, the post office could have !#@?!'d up the disk on the way to me. And finally... and what >I< think is wrong (because it seems to be the thing wrong with my software these days) is the incompatibilty of my damned 1200xl. Does ANYone out there have Quick and a 1200xl. If so- does it work!? Does anyone out there have Quick and an NTSC 8-bit. If so- again- does it work!?!? I've been frantically trying to get in touch with my 65xe owning friend in town (closest 8-bit owner I know who has th thing working!) but can't. I'd just like to not have to wait TOO long or go through TOO much trouble to find out whether or not I have to upgrade my 1200xl or mail back Quick.

Finally: re upgrading the 1200xl to 800xl/600xl compatibilty. Does this just require the purchase of an 800xl/600xl OS chip and a swap to be done? I know Bob Woolley does this upgrade (not sure if this is how it's done) as well as adding a PBI port to the 1200xl (I think I want one of those too.. but not too soon). Anyways- I'd rather not send this thing out (1 week was too much already to be w/o my 8-bit!!!). Should I just order some chips from BEST or B&C and try Quick when I get 'em?

Thanx alot. BTW: Get a sleeper if you go ANYWHERE by
train!!!!!!!!! (UGH!)
Bill (I'm
BAAACK!)

>Please, people, whenever you discuss ANY hardware trials you have done, you
>MUST state exactly which hardware you used, otherwise whatever you say has no
>meaningful context. (BTW, I'm not at all certain the list of Percom model
>variations mentioned above is ALL of them. Furthermore, there were numerous
>hardware/firmware variations evern among the same model; I swear I don't think
>Percom ever built the same drive twice.

Thankyou, thankyou, thankyou, Ben, for this info...I was depressed
about the fact that mine would not read both sides.. I have an
RFD series Percom. I don't think it is double sided..from my tests of
IBM 5 1/4 and 3 1/2 drives.
Although, I just got though talking to Tom Hunt and his Percom with a
IBM 360k drive DOES FORMAT ON BOTH SIDES. His has a printer port on
the back and 2 card edge connectors and is an SPD series.
Also he told me that IBM drives are very light sensitive and wont
format if they are out of the case and I tested the 5 1/2" out of the
case..maybe thats what my trouble was.
So, if any one has a SPD series Percom for sale, I'm interested;
else I'll just have to get my hands on an XF551 controller.
Thanks again Ben.

You need more than an R: handler to port a game play over the modem. You need a Color Graphic System..which BTW is already produced by Tom Hunt on CTH BBS 419-368-4413. The thing produces real color graphics gr.8, gr.9, gr.15 I know cuz I got it on my BBS too. Tom's currently writing a Alternate Reality like game to be played over the modem with Atari CGS. Of course, you have to have Bobterm w/CGS handler to see it. It also works by a Joystick and has many, many different fonts that load from ram-disk. Tom wrote a rd that works from stock XLs so that they can see CGS too. The only ones that can't have CGS are stock old 800 ataris....requires 64k not 48k.

>it, I will post the program.
>
I too have written programs that find the DEFINITE integral and/or NUMERIC
derivative of a function at a certain point. But, from what I have seen
of Derive/Mathematica type programs (which the original post refered to),
they are able to find the INDEFINITE integral and/or the indefinite (is
that the right term?) derivitive, that is, the function that expresses the
int. or der., not just the answer... But if all you want is the numeric
answers, or a function grapher, yes, Atari BASIC will do the job with not
very much problem at all!

Anybody remember ALGICALC (I believe that was the name)? It was a program written in Atari BASIC which could do various mathematical stuff, including differentiation. You could give it x^2 and it would come back with a derivative of 2x. The user interface sucked major goat eggs, but it predated programs like Mathematica, TK Solver, MathCAD, et. al. by MANY years, and ran in BASIC on a "lowly" 8-bit machine.

Well, being the original poster, all I can relate is what was told to me.
George DID in fact own an Atari, he DID in fact bring it to B&C to be
fixed, he DID in fact want it fixed, not replaced, since it was used in
his movies. Maybe the owner of B&C is confused about which movie (SW or
ROTJ).

Another interesting point, later on, George and Atari did in fact come up
with some deal, and that was why Lucasfilm Games was created. Too bad it
was not honored when Atari was bought.

-------============>>>> A T A R I C L A S S I C S <<<<============-------

----------=====>> A New Magazine for the 8-Bit Enthusiast !!! <<==========-----

Greetings Fellow Atari 8-Bit Users!

My name is Ben Poehland, and I'm pleased to announce that I shall be serving as Managing Editor of Atari Classics (AC), a new magazine exclusively devoted to the Atari 8bit user. If you are among the thousands who have bemoaned the recent loss of nationally distributed magazines that once supported your beloved 8-bit, I'm here to add a ray of hope to your 8bit future!

The philosophical orientation of AC- incorporated in its Manifest- is to be a magazine "of, by , and for the Atari 8bit user". Unlike previous 8bit periodicals, the content of AC will directly reflect the expressed desires of the user community, especially as recorded during the Mail-In Campaign conducted January 15- May 2, 1992. The magazine will be staffed by members of the user community, and its content will be drawn entirely from the user community.

Unicorn Publications, already well-known for its outstanding Atari Interface Magazine (which covers both the ST and 8bit markets), has agreed to provide publishing services for AC. AC and AIM will be essentially independent publications, and the addition of AC to Unicorn's stable of products will not affect AIM's present subscribers. One of the many unique arrangements concerning AC is that its actual day-to-day operation will be largely in the hands of the user community rather than the publisher. Whatever "flavor" we decide to give it will be entirely our own.

Atari Classics represents a unique experiment in the history of the Home Computer Revolution that began in the mid '70s. With Atari Corp.'s cessation of support for all 8bit products beginning January 1992, an entire class of machines with a global installed user base numbering in the hundreds of thousands was abandoned along with the community of users who still use them. But for the first time, a rejected user community has marshalled its resources and declared its right to exist independent of Corporate America. We respond to Atari's challenge in a way that would make our forefathers proud: by rolling up our shirtsleeves and doing the job ourselves!

This will be YOUR magazine. AC will succeed- or fail- on the number of subscription orders it receives. Although seed money to print the Premier Issue has been provided, the magazine will need 500 paid subscriptions to succeed. A limited production run of 800 issues is scheduled for October or November 1992. Most of these will be distributed- FREE OF CHARGE- to the roughly 600 people who sent in commitment cards during the Mail Campaign.

That's right: if you sent in your card,

YOU WILL GET TO READ THE FIRST ISSUE FOR FREE BEFORE YOU DECIDE TO BUY.

(When was the last time you saw a deal like THAT???)

Of course, there were some folks who got missed in the Mail Campaign. So we ordered up those few extra copies which will also be distributed for free. First come, first serve, please don't block the stampede! You can write to:
Atari Classics
179 Sproul Rd./Rt. 352
Frazer, PA 19355 USA
ATTN: B. Poehland, Managing Editor

to have your name added to the list for a free copy of the Premier Issue. (No guarantees, and be sure to include your postal mailing address!) If you sent in your Campaign card it will NOT be necessary to request your free trial issue, as your name is ALREADY among the LUCKY 600!

The basic subscription fee is $25/year in the USA, with higher fees for Canadian and other non-US subscriptions. Full details on subscriptions will appear in the Premier Issue and in future announcements. Beginning in 1993 the magazine will be distributed bimonthly (6 issues/year).

A software disk bearing programs published in AC plus selected offerings from the Public Domain, will be available separately for $9/year in the USA. The disk will be distributed independently but will be timed to appear with every other issue of the magazine (3 disks/year). Full details on disk subscriptions will also appear in the Premier Issue and in future announcements.

The content of Atari Classics will initially lean toward user applications, hardware tutorials and modifications, programming, and software reviews. We plan to agressively recruit paid commercial advertising from scarce 8bit vendors, and to publish periodic lists of current 8bit supply sources.

Best of all, PAID subscribers will be able to place FREE ads in AC to buy, sell or trade their personal 8bit treasures! (But of course, yah gotta SUBSCRIBE first!)

And, we'll have a whole bunch of other stuff, contributed by some of the most talented writers and hackers in the Atari 8-bit world, authors whose names you've seen gracing the pages of ANTIC, ANALOG, Current Notes, and Atari Interface Magazine. (You'll notice not very many details there- we wanna pique your imagination!)

As of this announcement (August 5, 1992) only a few of the Staff positions at AC have been filled. We are starting completely from scratch, but anticipate most of the administrative machinery for operating the magazine will be in place by the end of August and production begun on our Premier Issue. (We'll need a month to get used to working with each other in an environment of near-total chaos!)

And when you see that first issue appear in your mailbox this autumn,

IT WILL BE YOUR TURN TO DECIDE THE FUTURE OF YOUR MACHINE !!

Please post/copy/distribute this announcement freely, and stay tuned for future announcements !!!

3311. ATARI CLASSICS: Update & Personal Notes

CC: POEHLAND
Subj: ATARI CLASSICS: Update & Personal Notes

I just re-posted the press release announcing the birth of Atari Classics (there always seems to be a few folks who don't get the message first time around).

Yesterday I began receiving letters from people who were missed in the Mail Campaign; their names are being added to a list of people who will be sent those extra copies of the Premier Issue that will be produced in our first print run this coming Fall.

My apologies to those people who tried to contact me last week following the initial announcement of AC's birth. I was- uh- indisposed. I'd like to share with you denizens of the Net a little of the situation surrounding the final moments leading up to the official creation of the magazine.

Back in June I submitted to Unicorn Publications a written outline detailing my vision for the organization & operation of the magazine. All during the month of July there was a lot of backfield scrambling as discussions with Unicorn proceeded & various questions/problems were addressed, resolved, & incorporated into the plan (which is now known as the Atari Classics Publication Manifest). By the end of July we had pretty well reached an agreement in principle, & had arrived at the point of committing signatures to paper with a little money to lubricate the machinery of progress.

In the meantime my physician (alias "Dr. Moreau") had scheduled me for reconstructive sinus surgery at 7:30 AM on August 3. Wouldn't you know it, all the final preparations for AC coincided with all the preparations I had to make for going in the hospital (one of these days I'm gonna lay bare hands on the Murphy Demon & choke the devil out of him). So on the weekend of Aug. 1-2, I had to really hussle my butt.

On my way to the hospital at 6:00 AM Aug. 3, I stopped at the post office to drop off a 2-day air package to Unicorn containing all the final papers. A few hours later I was under the surgeon's knife, dead to the world, undergoing a procedure called turbinoseptaplasty (reconstruction of bones in the sinus/nasal cavities to allow proper breathing & permit the cavities to drain properly). I had been assured by the quack it wouldn't hurt much. Boy did I buy the Big One!

If any of you have ever heard any nightmare stories about sinus surgery, let me just assure you they are all true. Especially the more exaggerated horror tales. For the first 48 hours I staggered around feeling like I had kicked in the face by a mule. The Mother of All Headaches. Also toothaches. Plus a

little barfing as the anesthetic wore off. Just a wonderful little picnic.

I got home Aug. 6 a little the worse for wear, barely able to speak. I called Unicorn that night & was gratified to hear they had received my package & it was OK to release the announcement about AC.

Whoops- that was Aug. 5, not 6.

I had planned to spend the rest of the week calling up folks & recruiting for staff positions at AC while I was recuperating at home. Mother Nature had other plans for me. Right after releasing the announcement, my condition sorta took a nose dive (if you'll excuse the pun). I totaly wimped out the next 2-3 days. There's just some stuff you can't argue with, no matter how tough you are.

But by Aug. 9 I was coming back strong. Lean, mean, & ready to kick butt. Since then I've been making a number of personal phone contacts, & AC is about 25% up to strength. We don't yet have the critical mass of warm bodies needed to begin work on the Premier Issue, but I'm managing to reel in staff people at the rate of about one a day, so we are getting there slowly but steadily.

If all continues to go well as it has for the past few days AC will be at critical mass in another couple weeks. Things are looking good!

About that doctor. Let's see, yeah, it's a little hazy but with a few practice tries I think I'll be able to tie a pretty good noose. 13 coils, right?

This program will not give you a function that expresses the int. or
der., but it plots the function, gives the roots, and gives the mins
and maxs. DEFINITE integral and/or NUMERIC derivative of a function at
a certain point would be easy to add. I just put this together so my
son would have fun with plotting. The program was written in TURBO
BASIC. I stole the plotting section from another program. The equation
being solved in in line 30

writes:
>
>Thankyou, thankyou, thankyou, Ben, for this info...I was depressed
>about the fact that mine would not read both sides.. I have an
>RFD series Percom. I don't think it is double sided..from my tests of
>IBM 5 1/4 and 3 1/2 drives.

Joe,

I've got a Percom RFD-44S1 and it's most definitely double sided. In fact,
I have managed to snarf a currently unused 360k mechanism from work and can
format it double sided off the slave port out the back of the Percom box. If
your RFD won't work double sided there may be a bad chip on it. I know when I
first got my Percom back in 1983-4(?) the WD 1795 controller chip was flaky.
It would do DS just fine until it heated up (after about half an hour). After
that DS wouldn't work worth s**t, but SS was OK.

Anyway, guys, I've done some digging, and I have discovered some information
regarding Percom supplies. Some of this is old news, some of this I found
this morning after making a couple of phone calls.

Old News:

Some time around 1985 Percom dumped all support for the classics (sound
familiar?). At that time Computer Service Land, in Chantilly, VA, obtained
whatever necessary rights from them to become *THE* authorized Percom repair
depot/supplier. I know this because I purchased an upgraded ROM from them for
my Percom RFD drive in 1987. I called them this morning to see if they are
still in the business of supporting Percoms and the answer, surprisingly enough,
was "No". However....

New news:

Around two years ago, CSL sold their entire Percom inventory to an individual by
the name of Robert Burtt. I called Robert this morning to try and get a feel
for what he has on hand. Before I give you the list, let me add this caveat.
He does not repair Percom drives, so please don't send him any. He doesn't

have a list (except in his head) of what parts he's got on hand, but if you call him with a specific request he will know whether or not he can help you.

That said, here's a rough list of some of the things he's got:

Drive cases/power supplies
Drive mechanisms
Controller boards (both the AT88-SPD and RFD)
Cans of Percom drive case paint (believe it or not)
Generic 8-bit stuff (he wasn't specific)

Most of the boards he has are only partly populated. If you would like to buy a board and don't mind looking for the missing parts yourself, he indicated that he would sell these at a fairly reasonable price. To get a fully functioning, tested, board would take a lot more time and likely cost you a few more bucks.

I asked him if the source code for the ROMs was available. He said he thought he might be able to find a copy of it somewhere, but that it would be on an Apple // format disk, since Percom did all their development for the ROM on Apples. I personally think it might be kinda neat for one of you ML gurus to get hold of this and try to add UltraSpeed capabilities (if possible) to the Percoms.

Here is how you may get hold of him:

Robert Burtt
(703) 641-9764 (between noon and 10pm EDT, please. This is a home number.)

Sorry, it didn't occur to me to get a mailing address.

I hope you find this information useful. I know I did.

3314. Math Progs for the 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-13 19:18:27 UTC
From: JJMCWILL@MTUS5.CTS.MTU.EDU
Message-ID: <9208131847.AA11497@nettlerash.berkeley.edu>
Source record: 109759

To both posters:

Yes, I remember how you can have BASIC modify itself by printing the
y=f(x) equation with a line number before it, and do some pokes, and
the line becomes part of the program. I was thinking more along the
lines of something written Pascal, C, or Action! to improve the speed,
or even use Compiled TurboBASIC XL (you listening Bill K. ?).
With these, the self modifying code method of allowing BASIC to do
the function interpreting goes out the window.
With the popularity of RAMDISKS and bigger disk drives,
indefinite derivatives and integrals could be handled with look-up
tables could they not?

Jeff McWilliams

3315. Atari 8-bit for sale

Newsgroup: comp.sys.atari.8bit

As much as I hate to do it, I'm selling what I have left of my 8-bit
stuff. If you are interested in something, make an offer.

Atari 800XL with Power supply.
Atari 130XE with power supply.
Atari 1050 disk drive. (Sealed power supply does not work)
Atari 1050 with US doubler. Power supply works, but has been opened.
Atari 400 in pieces. Probably dosen't work. Parts anyone?
Atari XE modem. (The tiny 300 baud one) Broken (drops connections)

I also have a few game cartridges, bunches of disks full of programs
that I probably shouldn't have, an atari trac-ball, a pair of good
working genuine original Atari joysticks, and probably some other
stuff I've forgotten. Pick up in Lafayette, LA or specify how
you want it shipped. (Shipping probably won't cost too much,
but convincing me to box this stuff up and haul it to the UPS
office will) ;^)

3317. 1200XL Video/Composite -> CGA/Dead 800 Color

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-13 21:26:26 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9208132126.AA15389@smithkline.com>
Source record: 109764

Whew, there seems to be a lot of questions lately about video. Being of the extremely nearsighted persuasion, video has been one of those subjjects near & dear to the eyes of the 8-Bit Alchemist. Or at least it used to be, before I became a Managing Editor Person *sigh* . OK, here's my $.02:

Video in the 1200XL is a nasty beast, the output circuits are more complex than in virtually any other 8bit product, comprising something like 6-8 transistors including feedback loops & other yucky things. I have no idea how well it works, having never seen the video output of a 1200XL. I gather 1200XL owners aren't all that happy w/their video (some of them anyway).

I regard video hacking more as art than science, because much of what you observe on the display is so very subjective. I use words like smear, grain, blur, bloom, fuzz, streak, & artifact to describe the various defects I look for when I subjectively analyze display quality. But those words are meaningless to somebody else who hasn't also seen exactly the same phenomenon I see when I use that particular term. And really poor displays can combine some or all of those defects to give a screen that an untrained eye would be unable to describe in the quantitative sense required for a followup electronic analysis. Add to that, you must FIRST ascertain that what you are seeing is indeed being generated by the computer & not the monitor itself. Sheesh!

We 8bitters aren't the only ones suffering. The composite output on my STe is pure crap. From an electronic engineering point of view, there is virtually no excuse for the video atrocities Atari visited upon the composite outputs of all its products, its sheer incompetence. No one at Atari EVER understood analog video. God bless the Tramiel Entente.

Sorry, Jeff, you're a little off-base RE: your comments about my Super Video REV 2 upgrade. In S-V REV 2, the color/composite/mono outputs ARE all impedance matched (to 75 ohms or pretty close thereto). The switch has nothing to do with impedance matching but instead serves the purpose of enabling the composite output, which would otherwise be disconnected as a result of improvements made to the luma circuit. The problem is that having composite connected while you are using mono degrades mono quality via color clock leakage which makes mono look grainy. The switch is there for folks who don't have a luma-chroma monitor & must use composite to get color. For mono users, using the switch to disconnect the composite output cleans up the mono display noticeably.

Kevin Chase inquired about converting C-V to CGA. I think I fielded that question about 6 times/yr when I was at Current Notes. The answer is: NO, it is NOT easy to do. Full analog C-V consists of: red, blu, green, H-sync, V-sync, Intensity, & audio, all encoded into one signal. You would have to decode, isolate, & clean up the individual signals, then send them all back out individually in their digital representations w/suitable impedance buffering. Not trivial. Over the past couple years both Radio-Electronics & Popular

Electronics have published any number of mod articles, most of which don't produce all the signals I would like to see on the output.

Man, if EVER CSS were seeking a new product idea, this HAS to be it. This suubject of analog -> digital video conversion just keeps coming back again & again, it won't go away. (Bob Puff, I hope you are reading this!)

Forget about going into your 8bit & extracting digital video signals from some place on the board. The color signals are there, but not all the required basic video signals are available. They are locked up in the GTIA & not brought out to pins where you can get at them.

There ARE possibilites for directly extracting TTL mono from the XEP-80. For personal reasons, however, I don't want to get into that & will not answer any questions about it.

And finally there was J. Katz's inquiry about dead red in his 800. Sounds to me like a possible failure of the CTIA or one of the output buffer components. I can't recall if the 800 uses a 4050 to buffer some of the video signals; if so replacing that chip could be the fix. Output video circuits in the 800 are almost as complex as in the 1200XL. I'd look for a bad coupling cap or a bad transistor somewhere in that mess. Most 800 machines are >10 years old, it's time for electrolytic failures to start showing up. There's a pot in there to adjust the color balance. Corrosion/crud on that pot could be the culprit. Treatment of the pot with Cramolin followed by realignment of the color (using COLORBAR or TESTBILD software) is the prescription there.

Gee, this was fun! Now back to this boring magazine stuff......

Well... so far I can't run Das Omen demo, Fred or Mission Shark, or
Quick on my 1200xl. (blah blah you all heard this before, right?)
Anyways, I was pretty surprised when Jeff McWilliams left me mail
explaining a little of the process. >I< thought it would be something
simple like pulling the 1200xl OS chip out and plugging an 800xl or 600xl
or XL/XE OS into it. He mentioned the need of a desolderer and solderer!
YIKES! Aren't ALL the chips in this thing socketed!?!? Or at LEAST
isn't the OS socketed as well as the other 20 so chips!?!? (exaggeration,
I know!)

ANyways... I would REALLY appreciate any textfiles on upgrading the
1200xl to make it fully compatible with the 600xl/800xl & XE series (I
don't want built in BASIC or a PBI port (well...ONE day I'll get the
PBI) Does it really take ALL that, Jeff?, or would that include hacking
a PBI together!? Bob Woolley- if you're out there- how much would you
charge for doing the OS upgrade if it really takes this much work? And
Jody Lenn- perhaps I >WILL< buy that 65xe from you!? ;)

Thanx in advance. PLEASE gimme ALL details! (I don't wanna haveta guess
about things when I do this and then kill the only working system I've
ever had... other than the 2600 w/ BASIC and the Timex Sinclair 1000!
haha)
Bill
(sniffle sniffle...
it don't WOOOORK!)

Package Deals Can Be Arranged.

I have the following hardware for Sale:

1 1050 Disk Drive w/Power Supply and SIO cable $45
Works Great!! w/Dos 2.5 or Mydos your choice

Xetec Grafix AT Printer Interface $15

Books: Mapping the Atari (w XL/XE maps) $7
Computes Atari Graphics $6
Computes Second and Third Books of Atari $5 each
Analog Compendium $5 (lots of type in programs)
Creative Atari $5

I have the following program disks for sale:

Dragonriders of Pern $7.00

Dimension X $7.00

Kampffgruppe: $13.00

MULE $15

Alternate Reality: Dungeon - $12.00

Jupiter Mission 1999 (4 disks!) - $12.00

Napolean in Russia - $10.00

Music Const. Set - $8.00

Pinball Const. Set - $8.00

Blue Team Bridge - $7.00

Transylvania - $7.00 (no docs)

Zaxxon - $5.00 (800 only, FIX-XL, translator don't
work!!!!!!!) (no docs)

Temple of Apshai - $5.00

Suspended - $3.00 (Original, lost docs)

Mail Order Monsters - $7.00

Super Huey - $7.00

Page Designer -$8.00

Deep Blue C w/mathlib - $12.00

All items have docs unless otherwise mentioned.

Buyer pays shipping on all items.

3325. CGS and all that good stuff...

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-14 17:02:05 UTC
From: phbill@cyberden.uucp
Message-ID: <7HaiPB2w165w@cyberden.uucp>
Source record: 109776

How many people use the <C>olor <G>raphics <S>ystem upgrade for BobTerm? To ME it felt like quite a bit of work setting the thing up, especially since I no longer use Atari DOS 2.5, which is to my knowlege, about the only version of DOS on the Atari (other than perhaps its "compatible" DOSes, like SuperDOS) that allows numbers to be the first character of a file name. The instructions explained how to go about fixing MyDOS to use numbers in filenames (all the fonts it uses are numbered from "0.0" to "9.9".) >I< say why not just rename them to "F0.0" through "F9.9"?! Rather than going through all the hassle of patching the DOS for this one specific program. I'm not sure the fix was even 100% compatible with my version of MyDOS (the 4-digit sector count one).
Another big let down was the need to install a RAMDisk (which I NEVER foo with any more because I STILL only have 48k!!). Why not just have a file called "FONTS.DAT" and have it load up and then the program can just point around in it, rather than going through the trouble of setting up a RAMDisk.
And FINALLY, yet ANOTHER let down is the fonts. Call me one using a 1200xl (which supposedly has bad video output) on a 13" SONY TV (which I suppose in comparison to a good ol' monitor REALLY sucks), but to me those fonts weren't anything special. >I< think the entire program should be graphics screen oriented (MAYbe a little text window or something) so all the fonts can be mixed, rather than when a new font is selected, the entire screen changes. If a routine much like "TEXT" in TurboBASIC XL, or even just a byte copier (which means you can only place the characters in 40 positions across the screen, rather than 320 like with "TEXT") was added, you'd barely even have a need for the text window!

Anyways...these are just my ideas. I don't even know of a CGS supporting BBS to call ANYWHERE. (Well, sure I have a few numbers in the manual, but I have NO idea where they are. Either that, or they're on the Eastern half of the country...) Are there any CGS boards in any of these area codes:?

415
510
707
408

???
If so, PLEASE give me the number so I can try this out and give it a second chance. For now I just live with ASCII and the occasional b/w ANSI.

Thanx. (To tell you the truth, now that I've got Quick (IF I can
get it to WORK!!), I might just try making my OWN
version of CGS.. Who knows!? Oh, BTW: BobTerm was
written in Action!, wasn't it???)

Yes, modem play is a definite possibility, although I don't know how multi-line BBSes get more than two people online at once. We also kicked around porting the program to other platforms, and connecting them to the SIO line. We really only use about three lines on the serial cable, so other systems could probably adapt fairly easily.

But we're first going to get the SIO version going. Someone asked if we were going to sell the octopus cable/cable box. We probably could, and might, but we'll also describe how to do it yourself with readily available hardware (existing SIO cables or SIO connectors).

I seem to remember an article in one of the 8bit mags like ANALOG
or whatever, did an article about the use of the 800 & Lucasfilm.

It stated that the 800 was used to catalogue the sound effects and
was occasionally used to *provide* the sound effects, although they
were never used raw, the 8bit voices were used in conjunction with
other soundsand audio trickery. This was around 83 so I guess it would
be relating to Return of the Jedi.

Steve Lin's anwser to my question:
> Yes, it just skips right by it... Once I had a 130XE (before it got killed
> by a Lightning? surge :( ), and I still have my trusty old 800... When you
> boot up a disk with RAMDISK.COM,it seems to ignore it, it just goes to the
> DOS menu like normal, no D8:, no nothin!

I wonder how the DOS determines that it is running on a 130XE and
not on an 800?
Does it just try to switch to the extra RAM and then poke around
to see if something changes?

Hi folks,

I received a post card from an Atari user who wanted the first issue
of Atari Age magazine. Unfortunately, I had just sold my set. In hopes
of giving this person a bit of help, I thought I'd post his address
here and maybe one of you would like to sell him the issue (or a copy?).
Here it is:

Andy Floyd
114 Euclid Ave.
Minerva, OH 44657-1519

Appearantly he can read net news, but has no posting ability.

Please DO NOT mail replies to me, since I do not know Andy at all.

Thanks!

>DOSes, like SuperDOS) that allows numbers to be the first character of a
>file name.

Bill, try using Sparta3.2d, it is the prefered dos...goes off without a
hitch using that. No problems with #s as the 1st character of filesnames
either.
Yes, I use it. All you got to do is read the docs.

>Another big let down was the need to install a RAMDisk (which I NEVER foo
>with any more because I STILL only have 48k!!).

Sorry, Bill, but it takes a 64k machine to run it, at least.
It wont run from stock 800s. On stock 800xls there is a .DCMed file
on the conversion to use Atari dos with a small RD to fit the fonts in.
The reason the fonts NEED to be in a RD is they have to load FAST.

> Why not just have a file
called "FONTS.DAT" and have it load up and then the program can just
>point around in it, rather than going through the trouble of setting up a
>RAMDisk.

There's not enough memory in the 8bit to handle the modem handler, Bobterm and the CGS
handler and what you propose.
The CGS system is an efficient, well thoughtout system and I doubt if we
had it before this that the 8bit would have died so fast.
Comeon, Bill, most of us have ramdisks!

>And FINALLY, yet ANOTHER let down is the fonts. Call me one using a

>something) so all the fonts can be mixed, rather than when a new font is
>selected, the entire screen changes.
Sorry, Bill, but I think the fonts are quite attractive. The program is
graphics oriented..the Sysop only has to choose a graphics mode to be sent
to the receiving computer and the handler
tells the system to change back and forth. Also, it looks fine from my
son's RCA Colortrak TV.

`}

Hi Bill, remember me? I think you called my board once or twice.
anyways, your message on the net was sent to me for a personal reply.

First of all, I'm sorry that you didn't like using the CGS handler. I spent alot of time and effort into it, trying to do two things. First, to establish some kind of graphic standard for XL/E computers. The second thing was to provide a handler which works with the BEST term program ever written for these machines. From the many users that choose CGS mode on my bbs, and from the many Oasis, Pro!, and Carina sysops who download and use the CGS bbs modules, I guess it has made telecom more enjoyable for more than a few people.

If you think setting up CGS is a pain, try installing some drivers (by hand) on an IBM system. Without an auto-install program, it can take several hours, or even days.

The CGS handler can work with any decent dos that allows normal alpha numeric characters for filenames. If you are using a version of MyDos that doesn't support this, then I suggest that you switch to Sparta 3.2d.

There are now 20 official CGS fonts, with several more recently submitted for inclusion on the official CGS font assignment list. These fonts have been sent in from all around the world. Just this week, I assisted a sysop in Amsterdam Holland in getting his bbs to support CGS. CGS boards are poping up all around the world. But anyways, the CGS font system is very flexible, allowing up to 99 fonts to be installed at any one time. This ammounts to 101,376 bytes of font data! Granted, I doubt that any bbs will ever require THAT many fonts to be online at any one time. But most will have anywhere between five thru a dozen.

CGS is much more than just fonts. It also includes colors and graphics. The fonts are just the easiest and quickest to use.

One of the main reasons why the CGS handler doesn't exclusivly draw text to a graphics screen, is because such a system couldn't keep up with 9600 baud. If it can't handle 9600, I'm not interested in it. BobTerm/CGS can easily handle 9600 baud.

The fonts don't HAVE to be in a ramdisk. They can also be placed on a hard drive. The reason why they cannot be placed on a normal floppy disk is because they are too slow. Another reason is because of something called concurrent i/o. Simply put, if you have concurrent mode enabled for a modem, and try any i/o to a normal floppy drive, you

will crash the operating system. Period.

I'm starting to compile a list of boards that support CGS. Here's a
couple you might try.

Or better yet, call the CGS support bbs, at 419-368-4413. The
whole board is set up for CGS. But you'll find the online hi-res demos,
and the current versions of the files, under the Z function from the
main menu. Perhaps the best demo is the game demo. You use
control-cursor-up/down/left/right to move your little man around multiple

screens. It's graphics are kind of like Ultima or Phantasie. BTW, the cgs handler is up to version .093 now. The board is sending out CGS .093 control codes, so if your handler is an earlier version, you'll get control codes on your screen.

Feel free to try and give XL/E users a better system, using QUICK, Action!, AVUE PATHER, or any other language. Both BobTerm and the CGS handler were written in 100% assembly language. If you try and duplicate a 2.5k CGS handler in Action!, you'd probably end up with a 13k module. And then you'd have to add a special high-speed screen handler of somekind, and don't forget the file xfer protocals, etc.

It's probably the alien that jumps up and tries to destroy your
spacecrafts front window when you've landed and are waiting for a
lost pilot to enter your ship.

In the version I've got it's possible to determine if it's a
pilot or an alien that's approaching your ship. The aliens
look the same but their heads are green.

Btw, I wonder who's planet I'm rescuing pilots on. Perhaps it's
the aliens' planet? In that case, I'm the alien!

I had lots of problems like this one with my old 600XL which I got for X-mas '83 (guess it makes me an 8 year veteran too). I knew almost nothing about computers then, but a few years later I figured out my problems were caused mainly by:

1. The buggy BASIC revision in the computer. (What about BobTerm and the font editor. Are they written in BASIC?)

2. A faulty POKEY chip.

3. A difference in the OS between the 600XLs and all the other Atari machines I've ever seen. Synapse software's tape version of Blue Max couldn't be loaded into a 600XL computer because of this. Possibly caused by a modification in the OS made by the Swedish Atari agency, but I'm not sure.

Hope this helps,
Anders Skelander

Hang on a sec. I've never been 100% sure about my 1200xl. Does it have
48k or 64k RAM? The booklet that came with it said "64k, but 16k of it
can only be used by special programs" or something like that. Perhaps
THIS is the reason that my 1200xl don't work!? Hmm..

Yeees! I had a little function plotting program I made in Atari BASIC
and realized "this cannot be compiled!", since the compiled program can't
do direct commands (for example, insert a new line, or use the "DEL"
command. I THINK.. It's been a while. I have no/very little need for
THAT particular program for now.)

If I'm totally wrong, TELL ME! The ability to do that would be pretty
wonderful! BTW: here's how I would do it:

PRINT out the new line,
POSITION the cursor a bit above that line,
POKE 843,13 or something like that (I have that address somewhere.. this
is the "forced RETURN" 'command' (I have very unexact names
for the tricks I use! ;)).)
STOP the program
CONTinue the program (the "CONT" is a few lines below the new line)

Everything but accepting the new line (after the STOP) and probably the
CONTinue command can be done in a compiled program.

I have 2 copies (perhaps only one? I remember my brother and I had seperate subscriptions) of the #1 issue. I don't recall if they ever made a #1 issue in the magazine style (we will have it if they did) but I DO know we DO have the FIRST ever issue, which was b/w printed on newsprint. I will NOT sell this thing for ANY amount of money (well.. at least that you'd give up! :)), but I COULD send you a photocopy of it (for a small copy/postage fee, which I'll figure out once I know whether you want this or not... ie- someone else might give up a copy to you).

BTW: anyone else want a copy!? ;)

Message-ID: <2214206@mast.citadel>
Source record: 109897

I have two projects that I can not complete due to lack of information. One is what I would think would be of interest to any 8-bit user that is into graphics, including APAC and Colrview.
I have come up with a way to capture images (full color RGB) in 1/60th second. Actually, it would be 1 or 3 7680 byte images. The process would be to hook up a composite video source to the video digitizer (similar to Computer Eyes), strip off the h-sync and v-sync signals for timing, send the raw video signal through a Chroma demodulator to a 4 bit flash ADC. The pixel data would be stored in a high speed 32k x 8bit SRAM on-board the digitizer. The timing, communication and control stuff could be controlled by a 65xxx CPU running at >=4MHz. The control program/OS for it could be written in MAC/65 and stored on EEPROM or similar device. Communications would be in parallel via the 2 joystick ports using pins 1-4 on both for data, pins 5&6 on both for control handshaking and signaling. Finally, the data would be clocked into the computer RAM for storage on disc, printing and/or manipulation via a user interface program written in say BASIC XL or maybe TBXL or some such.
The second project is regarding the conversion of a BBS program from Turbo C on the IBM platform to MAC/65 or Action! on the 8-bit. The program is Citadel:K2NE and I have all the necessary source code, docs and other info for it. The conversion could be made to work on upgraded XL/XE computers of >128k ram if need be. I've been considering the Newell 4Mb ram upgrade anyway. On the other hand, it could be written in modules that swap in and out as needed and be compatible with normal 103XE computers.
Any takers?

>ports? What are the filenames at the site? (I can probbaly find them--are
>those the newest versions?) How much does it cost?

The primary FTP site for 8-bit Atari's (is it the only one?) is
atari.archive.umich.edu
(User: Anonymous, Pass: your address)
The 8-bit stuff is in /atari/8bit.
There is a subdirectory in /atari/8bit called sio2pc with all the information
you need on it.

And yes, I think SIO2PC is what you're interested in. It lets the Atari
send stuff to "Dx:" or "P:" which is intercepted by your PC. The PC
then simulates an Atari drive or printer for you. Except for copy-protected
stuff, I no longer need to use my 810. When you send stuff to P:, the PC
can send it to its printer or to a file. At present, the program doesn't
give you access to any ports other than the printer port, but what else
do you need? (Well, I could see some use for access to a modem, but that's
only if you want to use a graphic terminal program.)

Nope. That's how all 64k XL/E computers access memory. Since the 6502 is an 8 bit chip it can only "see" 64K at once. 48k of Ram and the 16K O.S. In order to see the extra "Bank" of memory (i.e. the other 16K) you have to swich the new bank with the O.S. or (now, I may be mistaken about this) with one of the other banks of RAM. So this should not be your problem (unless, of course, for some strange reason the 1200XL banks memory diff than the other XL/E's, but I doubt that).

I have the following things for sale.

Books:
Computes Atari Graphics $6
Computes Second and Third Books of Atari $5 each
Analog Compendium $5 (lots of type in programs)
Creative Atari $5

I have the following program disks for sale:

Data Perfect by LJK - $15

Synfile+ - $15

SynCalc - $15

Deep Blue C w/math library - $13

Page Designer - $9

Dimension X $7.00

Kampffgruppe: $13.00

Jupiter Mission 1999 (4 disks!) - $12.00

Napolean in Russia - $10.00

Music Const. Set - $8.00

Pinball Const. Set - $8.00

Blue Team Bridge - $7.00

Transylvania - $7.00 (no docs)

Temple of Apshai - $5.00

Suspended - $3.00 (Original, lost docs)

Mail Order Monsters - $7.00

Super Huey - $7.00

All items have docs unless otherwise mentioned.

Buyer pays shipping on all items.

Get your hands on an XF551 controller and you can run C.C.S.'s XF Upgrade
either a single drive conversion which converts the 5 1/4" drive 360k
to 3 1/2" 760k or the dual drive conversion which is both drives in
the same box.
XF single drv.conv w/Sony 3 1/2 drv.= $99.95 sh.$8
XF single w/o drv.= $59.95 sh.$5
XF Dual Drv conv. w/Sony 3 1/2 drv.= $139.95 sh.$8
XF Dual Drive conv. w/o drv. $79.95 sh.$5

Are you trying to tell me that storing, say, 16k in a RAM disk takes up
less room than storing 16k in RAM?? (remember, I'm using the patch that
adds that 101-sector RAM disk to an un-upgraded system (like min)).

And I still think those squiggly "|"s don't look very good! ;)
I'll try those numbers, ONLY after you tell me WHERE they are! :)

thanx.. I've yet to see CGS using the graphics mode (trying to
get it to do it manually, while not online is quite a headache! :))

a
Well, like I said before, 1) the fonts don't look very good on my system,
PROBABLY because MOST users (I am DEFINITELY one of the majority of users
anymore!) have GOOD monitors and DON'T have this crappy 1200xl video.
(tho I haven't compared it, lately since I have tons of video stuff
hooked up and the computer has to go thru a REALLY old VCR!, I must admit
it could've been made QUITE a bit better.) I do agree that choosing CGS
to work with BobTerm was a DEFINITE plus, but since I 1) have no CGS
boards to call, and 2) boot always from one system disk (which ONLY
installs Hyper E: and jumps to MyDOS (I have the /4(-digit) version)..I
don't have ANY extra RAM, and hate dealing with Atari DOS/MyDOS 1050
density problems), I only ever use the unchanged/upgraded/patched/whatever
you'd call it version of BobTerm (1.22). I SUPPOSE that, though you
were (unlike many programmers.. at least a few years back) smart enough
to make this fully compatible with everything you could think of, I have
these problems:

dedication to MyDOS, as well as having 100s of AtariDOS disks.
I'll never go back to Atari DOS for fear of messing up one of my
newer MyDOS disks

I have a 1200xl (could be the reason for the crashes I got with CGS ever
so often)

I have a 1200xl and a ***tty TV for a monitor.., again, wired via VCR, as
WELL as having a switchbox connected right at the TV's cable
input

I never use Sparta DOS (call me different, but I don't like it much, esp.
since I'm a TurboBASIC XL fan, and TBXL doesn't work with any but
the cart.version)

and finally: nowhere to call. The only 8-bit BBS I call doesn't even
use ATASCII, which is a shame because I always liked even that.

I guess I jumped the gun a bit because I never saw anything ACTUALLY use
the thing, and I also have an older version (I believe it came
with 10 or less fonts.. we seem to be getting new software
rather slow here in the bay area...)

...
>
> If you think setting up CGS is a pain, try installing some drivers (by
> hand) on an IBM system. Without an auto-install program, it can take
> several hours, or even days.

Ah... I must give you that!! :) This is one of 100s of reasons I'll
probably NEVER get an IBM ;)

>
> The CGS handler can work with any decent dos that allows normal
> alpha numeric characters for filenames. If you are using a version
> of MyDos that doesn't support this, then I suggest that you switch to
> Sparta 3.2d.

As I said, I have something like version 4.53/4 of MyDOS and the minute I
saw that ARC full of numbers for filenames, I said "screw this!", but
since I was pretty interested at the time, I finally got the attempting
to set it up.

>

> data! Granted, I doubt that any bbs will ever require THAT many fonts to
> be online at any one time. But most will have anywhere between five thru
> a dozen.

As I said, I guess the version I can with is rather old, as it had (I
believe) 10 or less fonts.

>
> CGS is much more than just fonts. It also includes colors and
> graphics. The fonts are just the easiest and quickest to use.

Well... Since I've never called anywhere that supports it, I can't say
I'm either impressed, or disgusted by it! ;) My MAIN reason for bringing
these things up is 1) I wondered if there was any other program that
could handle this type of stuff, and 2) how hard it would be to make the
fonts have one extra letter in them. Hell, how about rather than have
"0.0" to "9.9", how about "A.0" to "J.9"??!??! Or even "A.A" to "J.J"??
It would be REALLY nice for the users of Atari DOS 2.0 (it doesn't allow

numbers in names, does it?) and MyDOS (IS there a version that allows numbers??)

>
> One of the main reasons why the CGS handler doesn't exclusivly draw

> 9600 baud. If it can't handle 9600, I'm not interested in it. BobTerm/CGS
> can easily handle 9600 baud.

That's true. (call me one to be blind about 1200 baud ;)). HOWEVER, what types of drawing routines do you use? I think it would take just as much time, if not less to POKE the characters onto the screen. My only way of elaborating is to give a BASIC equivelent:

```
FOR J=0 TO 7
POKE SCREEN+X+(Y+J)*40,CHARACTER*8+J
NEXT J
```

SCREEN is the top of screen memory, X is the x position on the screen (0 to 39), Y is the y position (0 to 183, unless you don't mind it going below the screen), and CHARACTER is the internal character set code for what you want to be written to the screen. A routine like this in assembly... hell, anything faster than BASIC, could probably keep up with 9600 baud.. esp. if buffering and [^S](pause)-ing is done...

This is my major idea for CGS, or any other graphics oriented terminal interface....
>
> The fonts don't HAVE to be in a ramdisk. They can also be placed on a
> hard drive. The reason why they cannot be placed on a normal floppy

> something called concurrent i/o. Simply put, if you have concurrent
> mode enabled for a modem, and try any i/o to a normal floppy drive, you
> will crash the operating system. Period.

Well...THIS is obvious, even to ME! (esp. since I'm using 2 stock 1050s! haahhaah)

I think you've stated your point clearly.. I'm reading it as this:

upgrade!!! :)

I need more RAM and maybe a copy of SDX or SRP ;)

Just don't forget my ideas!: 1) letters instead of numbers for fonts (a simple little BASIC program could patch up anybody's old version of the program.. just rename all the files.) and 2) the quick 40 column text writing... it takes very little memory and doesn't use much FP, so it could easily handle 9600 if the other graphics routines can. (btw: can CGS do a fill???)

Sorry for jumping the gun like I did (I didn't mean to totall SHRED your program or anything

!!! It's just I
could see it being
made a little e-zer
to use for us
stock users ;))

> 1. The buggy BASIC revision in the computer. (What about BobTerm
> and the font editor. Are they written in BASIC?)

Well.. it hasn't happened any more... not since I went in and cleaned the thing. It mighta been a little short in the keyboard or something? (NEVER spill stuff in a keyboard... as Bush'd say: "It's BAD! It's BAD!")...

Anyways.. Re: BobTerm and DDIII's font editor...

BASIC!?!?! You need to get out and download a little more!
;) If I recall correctly BobTerm was written in
Action!? (help out folks!) And DDIII...I could look it up, but it's a less interesting program than BobTerm ;) (not saying I haven't been using DDIII twice as much as BT lately or anything! hahaha ;))

Anyone ever think about pattern-printing in DDIII? (since the subject has arisen itself..DDIII that is) I was thinking instead of the program printing out letters which are formed from a 16 dot high line, how about a 16 dot high dotted line, or something that sort of fades away at the top. How about inverse?! And too bad italics is a drag to use with the thing (too bad these 8-bits were made with so little memory! <snicker> (I should talk!!!)). Just imagine... using up 1/2 the disk space to print italics or inverse. And the patterning would look REALLY nice. Have the letters darker at the top and bottom and lighter in the middle... it'll look sorta metal :) (I love doing that on the screen with DLIs or multi-color text).

Well.. this is for Roy Goldman to do, if he ever feels it must be done. I'm sure it'd end up being hell to program in, esp. since the program has covered probably everything he ever imagined he wanted it to do. I sorta wish I coulda been there back in the beginning (God I'd've been more annoying than I am now!!)

Hey- anyone ever think of starting from SCRATCH and having resizable fonts!?!? How about resizeable fonts with 2 sets of patterns!? Outline it first, then fill it in with a pattern... god I'm going nuts with my printer... 9-pin it may be.

"good enough isnt"

I don't see how Bobterm could lose characters on an Ascii upload. Check the help files on your host system; also you might want to experiment with the delay rate. According to my notes, you can upload files to the archive by mailing them to jrd@stony-brook.scrc.symbolics.com . Be sure to include a description of the file.

3369. CrashMan!

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-18 05:33:33 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <maToPB2w165w@cyberden.uucp>
Source record: 109866

Hey all. Once again I've started on a new game, but this time (since I've had a TON of practice in this style of game, and I also have a better BASIC than I used back then..aka TBXL) I'll ACTUALLY finish it! :)

Of course there's a catch. I need some music files. When I say music files, I'm being pretty general, but that's the point. All I require is that it plays in BASIC, in the background. Hell, I don't even need an actual playable song, just the note data and I'll program it into Sound Commander. (Remember that? I think it was from Compute! It would use machine language to play sound effects. The only thing I ever made in it was that old Russian song- used in most versions of (the official) Tetris.) Anyways, back to the game.

The game is called CrashMan (remember the "Subject:" up there? ;)). It's a Stupid Mario Bros. clone (I've gotten quite annoyed with the 8-bit Public Domain clone called "Bros." which TRIES to mimic the entire game but does a terrible job.) Just like Bros., this is being programmed in TurboBASIC XL and will be compiled... and just like Bros., it will use an IRG mode 5 (GRAPHICS 13, the 40 x 12 4-colored character mode) but with a MUCH niced character set. I'm not positive, but from what I've got planned, CrashMan will be a bit bigger than Bros. (app.16k of data per level. 20 screens by 440 bytes per screen. BUT, each screen has a ghost (which will contain the data on what the "?" boxes will give, where the enemies start out, and where all of the secret things are), so the data for each level takes up 17600 bytes). Also, in Crashman, when you get the growth item (in Bros. and Super Mario Bros. it's a mushroom, in this game it's a beaker), you'll actually get bigger. Not only that, but unlike Bros., the player is a player (confused? - player as in sprite, rather than redefined characters, like in Bros.).

Well.. most of it is coming together rather nicely. I've got the character set defined, as well as an alternate Daisy Dot III Near Letter Quality font for printing out documents (I may make this a (the term has lost me).. like Valgus^2.. you get the PD demo and then pay a bit to get the registered version of the game along with documents, etc.) All I REALLY need to fit in there to be sure I have enough room in 48k! is a few music files. I'm not even sure how many level's I'll have (maybe I'll upload the Mapper program I made so people can make their own levels..?), but I'll probably only need about 4 or 5 different songs. (I don't want the thing to take TOO long loading! :)).

If anyone'd like to help me out at all (I still need a NICE title screen and some good Player/Missle animation done. I WAS going to get a friend of mine (who's an excellent artist) to draw a title on paper and then I'd digitize it and clean it up or do some other tricks to it, but he's in

San Diego for a while :-(.), you're welcome to. Just E-mail me and
we'll see what we can do.

Thanx. I hope this'll end up being one of my best projects in quite a
while.
Phbill

>news.groups with the rest of the discussion.

As several other posters have pointed out, there is no discussion
in news.groups. This could be because your crosspost was mistakenly
posted to _news.group_, as someone else pointed out, which means any
discussion would likely be going on in most systems junk directories,
unless they have just dropped it on the floor.

Also, if you check the newuser postings, you'll find an article
called "How to create a new newsgroup." This will give you all the
suggested guidelines for creating said group. Another suggested
source of interest is the " What is Usenet posting ".

One other thing. Two actually. You will find that an RFD will not
be considered real until it has been mailed to tail@rpi. Secondly, on
splits and reorganizations, it is customary to at least have a bit of
discussion on the affected groups before issuing a RFD, so a well thought
out charter and answers to the various questions that will be asked can
be answered.
Most of the questions I brought up in my original post are fairly
stock for news.groups regulars, and better answers are needed if you want
a snowball's chance of getting the group passed, which I think is unlikely
at best. In your proposal, you showed no reason why the new group would
be any different in substance than c.s.a.st or c.s.a.st.tech.
Why don't you just gateway the znet feed into c.s.a.st? It's not like
we're drowning in messages as it is.
Or better yet, gateway it to a mailing list, and let those interested
subscribe.

I like your ideas on DD3...I just wish Roy Goldman or someone
would write a patch or something to DD3 to include Star Color
9 pin printers. It would be nice to fill an outline character
with color or a patterened color or different color text onthe
same page.
I wrote a few routines to change the colors and go back to the
top of page to print another color but I have to exit DD3 to
do it.

Bill...these CGS fonts don't look good at all unless you run them
thru the Editor program Tom Hunt wrote for sysops or call a CGS
board with CGS running on your side....the boards I mentioned are
in ohio but the boards Tom mentions are in 519 (canada) and 707
(north western Calf. just above the bay area).
The new version (CGS093.arc) has patches and docs etc. of how
to run it on Mydos and Ataridos.

>>What discussion? I've been checking news.groups for a couple of weeks, now
>>and haven't seen a single article about comp.sys.atari.znet!

>>Am I the only one missing this discussion?

>What is there to discuss? There is no question it should be done!

Sorry to disappoint you folks, but reading news.groups for almost
8 months now I didn't see the RfD there. I also checked David Lawrence's
recent status messages - there isn't mentioned any atari group.

So - if you want to create a group in a main hierarchy like comp you have
to get posted your RfD at least in news.groups and news.announce.newgroups.
I said "get posted" because n.a.n is moderated and therefore you have
to send your RfD to the moderator.

For details see the "How to create a New Newsgroup" posting in
news.announce.newusers.

Regards

Bill Kendrick writes:
> {..} How is this handled!? How much disk
> i/o speed is lost when this stuff is done???
> (cant wait to try something like this myself! ;))

The principle of playing music during disk i/o isn't very tricky.
The sound is produced during the immediate VBI .
There are two kinds of VBIs. One part is always executing every
1/60th of a second on NTSC computers. The other part, the deferred
VBI, is only executing when there's enough time for it.
During disk i/o only the first part of the VBI is executed, since
there's no spare time left.

The only problem in programming a sound routine for the immediate
VBI is TIME. Your routine can't be too long or it will
screw up the whole system. This is epecially true with NTSC, leaving
more time on PAL systems.

To set up this VBI as usual jump through the SETVBV routine after
storing the address of your routine in the appropriate registers and
the code for the immediate VBI in the accumulator.
The code could be $7 or $6, here I need help from someone who has either
a better memory or has his hardware manual handy.

Just try it out. I'm sure you'll find it out somehow.

3382. Re: CrashMan!

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-19 07:20:58 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <NXsqPB9w165w@cyberden.uucp>
Source record: 109880

Just a note (somehow I came on here with "49 new messages" and the latest was that last post from me!!).. I've been working alot on the instruction manual for CrashMan! and have even made a few DDIII fonts just for it. I'm still not sure how I'm going to get this program around. I could do it one of several ways (this is a LOT like how David Richardson distributes DDIII's User Guide).. I could send people a copy of the game one disk, as well as another disk (or on the flippy side of the one, if the game does only end up taking one side) which would contain the text files to be printed, and all of the DDIII fonts used. Of course this'd require they have the registered version of DDIII. Alternately I could send out the disk with a photocopy of the printed manual (which would cost a tad more because of the copies).

Then there's the PD version (I'm pretty set on having a PD version and a fully playable registered version) which COULD contain the full documents, but (the few pages, they may be) that'd take up a bit of space I could always have one ARC be the game with a short README file and another be the full DDIII printable docs.

Damn this is confusing!! How should I do this?! Does all of the above sound good, because it'd be very little trouble.

BTW: still need some music! (I have the Tetris song music lying around and (hopefully) easily fittable into the program, and I've also (once again!) stolen the "P.10" file from the Expo '91 Demo and stuck it in the game (as title music)) Again, raw note (0-255) and note-length data'd be just fine with me!

Thanx... this game should be completed within the month. (I HOPE!)

3385. secrets of $E477 (on my 130XE)

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-19 18:00:26 UTC
From: Marek Tomczyk <UJ1G@DKAUNI2.BITNET>
Message-ID: <1992Aug19.180026.21701@rz.uni-karlsruhe.de>
Source record: 109882

Just out of curiosity, I disassembled the first part of the
power up routine staring at $E477.
There's one thing I don't understand about it.
Somewhere at the beginning of the routine the OS determines if
the trigger of the 3rd (!) joystick has been pressed when the computer
is powering up. In this case another subroutine is called.

The interesting thing about it is that my 130XE doesn't have
any plugs for more than two joysticks. When I try to check the
hardware register for the 3rd joystick's trigger, it says that the
trigger has been pressed. Does this register have another function
on my 130XE than on the 400/800s?
I could guess that this register indicates the presence of extra
RAM or something. Am I right?
I recall something about the 3rd and 4th joystick ports of the
800s being redesigned for memory management purposes on XL/XE
computers and therefore no longer available to the outside world.
This is obvious for the PORTB register, but what has happend with
the triggers?

3386. Handling stuff during disk access

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-19 21:23:18 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9208192122.AA23146@brachot.jct.ac.il>
Source record: 109883

```
Aw, that's EASY!!!
All ya do is
A) turn off disk I/O noise (poke 65 with a 0)
B) Create a VBI which will occur BEFORE the system VBI by:
LDA #6 ; immediate mode
LDX #hi-byte of VBI routine
LDY #lo-byte
JSR SETVBV ; $E45C
; rest of prog.

The VBI can scroll, do music, anything you want, and it takes no time at all
to do, since this is M/L and we're not doing any huge things AREN'T WE?? (just
don't.) And it runs while the disk is running!! haha!!
The VBI routine has to jump to SYSVBV ($E45F) at the end, and I don't think
it needs to save everything on the stack, as the OS does it for you... not
sure though...
And the routine WILL stop on disk access if you do an LDA #7 in the init
routine (above).. That type needs to JMP to XITVBV ($E462) at it's end, and
it does NOT have to save the registers on the stack.
Those are my 2 cents!! 1..2.. ok.. -Itay

That glitch PROBABLY has to do with switching from concurrent modem i/o mode to disk i/o mode. What you can do is (as long as the site keeps up with BobTerm's 0 delay! hehe!) hit [^S] and [^Q] to pause and unpause the send (letting the site's returning data catch up) as the buffer gets close to 0. Then, write down what line your were on in the site's editor and when the entire thing is finished, go back and delete ANY non UUE characters (they stand out. UUE files DON'T have lowercase, or the "|" character (which BobTerm tends to send when it's telling the modem to "wait, I gotta do something!") You'll notice on some places that if you go to, say, the directory in BobTerm while on line... like this (I'm in BobTerm, of course!):

~~

I accessed the directory twice. >I< can't see anything, but when it went to do the directory I saw the Send and Recv. lights light up for a split second. Let me see what happened on that line (line 22)
Well... I guess I was wrong about the "|"s!! It sends carats.

Anyways... just a little note about BobTerm's "glitches" (I'll suppose that the "^"s may be the "pause" send? Maybe it's the "pause" but messed up? hmmm)

>computers and therefore no longer available to the outside world.
>This is obvious for the PORTB register, but what has happend with
>the triggers?

You are correct about the memory management. This location in no way corresponds to any kind of joystick or paddle input on the XL/XE's, so it is meaningless to associate the memory read with joystick trigger #3.

The OS code is checking for an XL/XE machine.

3389. Teknika monitor questions...

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-20 05:48:10 UTC
From: rkim@CALSTATELA.EDU
Message-ID: <199208200548.AA02598@opus.calstatela.edu>
Source record: 109886

I used to own a Teknika monitor with my 800XL. Overall, it was very
good, with both regular composite and separate video plugs. Colors
were very brite (maybe too brite!). Problems were the speaker (too weak)
and the power switch (stopped working, got stuck).

My question is does anyone still sell those monitors, and is Teknika still
around? I'd like to get schematics for it, just for the heck of it.
It looked like a TV with some modified circuitry... Nonetheless, the colors
and picture quality beats outs most of the other consumer sets that I've
seen.

Thanks,
Rich K.

> do it.
> --

Well having multiple fonts might be something to do it. 3 fonts all called "MAGENTA.NLQ", "CYAN.NLQ", etc. (course each "MAGENTA"'d have to be on a seperate disk, etc.) From there insert the "MAGENTA" disk, in which all fonts that need to print magenta have characters in them and print. Then insert the "CYAN" disk (which has again all the colors you're going to print, but only "CYAN", "PURPLE", and "GREEN", and maybe more have actual characters. Everything else has blank characters (no dots, but the proportional widths of each character remainds..)

If you want to print black (with only three colors printing, that is) you'd have data in the "BLACK.NLQ" files on all 3 disks.

Get it? That was pretty difficult to describe. To sum it up you have 3 disks, each with about 9 fonts on them. All 3 disks LOOK identical (same font files on them. All the "CYAN" files would have the same sector length, ditto w/ the other 8 fonts), but when the fonts are printed, sometimes they print out onto the page and sometimes they dont.

Hey.. how about 24-pin printer compatibility!? ;)

Steve, Steve, Steve! Unless I'm totally in the dark about this, Atari Age was produced ONLY as a magazine (as in physically touchable, glossy, with turnable pages!!), and never do I recall hearing about it being made into textfiles! Maybe you're thinking of Z-Mag or something!?!? hmm..

I wonder if >I< have EVERY issue they made. If they dropped like a fly I might have. If they warned an issue or two early that they were about to go belly up, I guess we just never got our subscriptions renewed.

I still think it was a REALLY good magazine. FAR better than Ninblender Power(less) will ever be. I recall reading something in the mail section of A.Age where somebody asked "how do you get the game to do this trick?" and they replied "if we said, it wouldn't be a secret!"...

Nintendo, on the other hand does things like: "press up, down, up, down, stand on your head, and pray this works... and then you should hear a 'bleep'. That's how to become invincible and start at the very last screen of the last level!"

ugh.. N.Power just makes those games utterly worthless and challengless.

If I had a map to Draconus (as in one I DIDN'T MAKE MYSELF, like you're SUPPOSED to in these types of games!) I'd never play it. I like the challenge.

No wonder I don't care that my friend
STILL hasn't returned my NES!! ;)

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <64340@cup.portal.com>
Source record: 109890

I've done it a couple of times, through both an 850 & a joystick with the MPP R: handler. Even wrote a dumb 1200 baud joystick routine for someone who didn't want to buy a modem to get the MPP handler to his Atari. It just sat there collecting stuff from the IBM at 1200 baud, then wrote the info out to a disk file. I've had minor problems with the software I've used. With the Atari, the last Xmodem block is padded to 128 bytes by adding extra characters. Something like(?) if you are sending 193 bytes, the 1st 128 go fine, but the next 65 bytes are padded with the CHR$(65) to make it to 128 bytes. Some IBM software stores the original file with this "garbage" appened to it. The reason why SIO2PC has so many advocates is it really is that good. I haven't finished my yet (like everything else!), but I just spent about the last month reworking a couple of hard drives & an old clone I wasn't using. If you plan on expanding the Atari, it's really a cheaper way of doing it. Parts for the SIO2PC run about < $10 & I found a 17 meg HD/controller for $22.50. You can basically end up with a lot of storage cheap.

Ok, well this is fine and everything, but I'd suggest.....
arc it (the disk, files, whatever), then uuencode it and POST IT HERE!!
Then it will go all over the nation (world) in a matter of days. I'd
pick it up here, and post it in my bbs, others could pick it up and
upload it to their local atari bbs', and so on.

If you don't know how, or don't have access to uuencoding the file,
let me know and I can post it to this news group for you.

I really wish there was a comp.sys.atari.8bit.binaries group for the
posting of public domain atari stuff. That would be excellant!

I have a few remaining 8-bit items that people still active
with 8 bits could use:

1) 1050 Happy drive with latest software
2) 1050 US Doubled drive
3) A hacked 400 that has a real keyboard, 256K RAM, and
a three position switch that allows it to look like a
48K 800 including 400-800 OS, a 256K 800 with Mosaic
style 4K block bankswitching, or a 256K XE with Newell
style addressing with XE OS and BASIC rev C. This machine
will run anything. Includes an extra PAL which has the
logic for doing most of the above wonders.
4) SDX cartridge

Everything works fine. Power supplies and DOCs included. Extra
drive belt included with the 1050's.

From: JJMCWILL@MTUS5.CTS.MTU.EDU
Message-ID: <9208210217.AA29010@nettlerash.berkeley.edu>
Source record: 109896

For Sale:

Teknika 13 inch color display monitor.
Has inputs for NTSC Composite, or separated luminance and chroma, and
audio.

300 pixels horizontal resolution using composite input
400 pixels horizontal resolution using separated input

Controls for H pos, V Hold, Contrast, bright, color, tint.

still have original owners manual.
Great monitor for Atari 8 bit, or as a VCR monitor.
Well taken care of, I have added a non-glare screen to the front.
No burn marks in the screen.
High voltage transformer was replaced a couple years ago and it has
worked fine since. I would normally NOT part with this monitor.
Simply put, it's one of the best I've used. But money is tight,
and I've got to let it go.

Asking $100.00

> The OS code is checking for an XL/XE machine.

For what reason?
I thought REV C of the OS has been exclusively installed on the XL/XE
machines. So why determine the type of the computer?
It wastes valuable processing time.

BTW: What does the subroutine do that is being accessed after
it comes out that the OS is actually running on a XL/XE machine?

Another question: Where is the hardware register STRIG2 (if it's the
correct name) wired to on the hardware level?

3405. I GOT A DUMB TERMINAL!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-22 01:39:45 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <y5wVPB2w165w@cyberden.uucp>
Source record: 109904

Hey everyone! My friend's dad owns a company that produces networking hardware and had bought a ton of old equipment for $cheap$ from a wherehouse and is now dumping it all. So I got to look through the stuff and just figured out that one of the things I picked out (look like a monitor) is a VT-101 dumb terminal! (I hope I'm right!!) We plugged it in and all that was on the screen was a blinking 80 column cursor, but I bet if I hook my SX212 up to it via the RS232 I'll be online with the thing! (I also need a keyboard, but that's been promised to me as well.)

The thing is (if any of you can help me out on hooking it up.. dont wanna blow myself to peices ;)) a Qume model QVT-101. It has a base with a brightness knob on the front, and on the back a power switch, fuse, and two 25-pin RS232 ports- one labeled "AUX" and the other "EIA." I suppose it would only take a little guessing as to what goes where, but I THINK that the "EIA" is for keyboards.

Now for the problem (other than where to PUT it!!?!?!?!). Since it has no drives and seems to simply be a monitor that you stick a modem and a keyboard into, I'll still need my Atari and good ol' BobTerm to do file xfers. I'm wondering if I can have BOTH the RS232 port AND the SIO port in at the same time. Would this short any of the 3 components out!?!?

Well, any info. on this here junked (but working) Qume "QVT-101" would be MUCH appreciated, esp. info. on hooking it and the SX212 up together. (there's no way for BOTH the Qume and the Atari to talk to the modem at the SAME time, is there!!?!?!?)

Thanx in advance. Happy happy joy joy! I gotta dumb term!!

Many, many people are scared off by a challenge. Y'see, if they can't
figure out in five seconds, they figure it's impossible. I, OTOH, play
at a game and if I die, I keep trying, because I *know* that it *is*
possible to get through that spot. If I turn out to be wrong, then I
lose all respect for the designer, who was too scatterbrained to know
how to create a properly balanced videogame, and I cease to play it.
Period. Properly balanced video games (includes almost all those
made by Atari) don't need solutions, just practice.

Probably the easiest way to hook this up would be to make up a special RS-232 cable with "receive data" connected but "transmit data" not connected, so the modem will send to both the Atari and the terminal but only the Atari sends to the modem. Then you could use the Atari keyboard and see messages on both the Atari and dumb terminal screens. On most terminals an AUX connector is used for a serial printer. The keyboard might have a DIN connector or a modular phone-type connector (I don't know that brand of terminal.) If you call different speed BBS systems (1200 or 2400), dumb terminals don't usually adjust themselves automatically; you might have to set the speed with a dip switch!

Message-ID: <1992Aug23.061058.10690@usenet.ins.cwru.edu>
Source record: 109808

Thats right.

If anyone knows where I can get one for around $30 or less,let me
know.
There was a local closeout store here in Cleveland that had them
for $29.99 and it came with 5 game carts!
Also,the local dollar store has most of the titles released for the
7800 for a buck a piece-new in shrnk rap and all!

Well,Just had to tell you all this so you wouldt go paying high p
rices for USED carts.

I guess i should snap up all they have and sell them here for $20
each;-)

Too bad I didnt pick up a 7800 when they had them-they sold out.

Thanks.

The EIA is probably the modem port. The AUX port would then be the serial
printer port (but it could mean considerably more -- see below!).

Does your Atari have an RS232 interface as well? This is where it can get
interesting (strange, but interesting 8-)).
>
>Well, any info. on this here junked (but working) Qume "QVT-101" would be
>MUCH appreciated, esp. info. on hooking it and the SX212 up together.
>(there's no way for BOTH the Qume and the Atari to talk to the modem at
>the SAME time, is there!!?!?!?)
>

There is! Without docs it's going to mean some guesswork (I'm basing this
on my experience with a VT-220, which had _3_ serial ports of various types)
and it's pretty much theoretical, but it SHOULD work.

You'll need and RS232 interface on the ATARI, access to whatever configuration
capabilities the terminal has (if the keyboard has a "setup" key, and it brings
up the internal menus, you're in luck; otherwise, your chances are very slim),
and possibly a null modem cable which will go from the ATARI's RS232 port to
the AUX port (it may not be necessary, a regular modem cable might do).
Without these, you might as well stop here.

OK, now on to the procedure. Pull up the terminal's setup menu and see if
is a section/submenu for the auxiliary, secondary serial, or serial printer
port (the AUX port, in other words). Then see if you can make the port go
bi-directional (as opposed to output only, if it was connected to a printer).
Now here is where you will need to find out if you need the null modem/regular
serial cable. If the section/submenu allows you to configure it as a data
terminal(DTE) or data communication(DCE) type port, you're in luck; you can

choose between a null modem or a regular serial cable, respectively. Otherwise, you will probably need a null modem cable. After hooking the computer up to the AUX port, configure the AUX port to match the Atari's parameters (you might even be able to up the baud rate to 9600, but it won't do much good, obviously). By then the Atari should be able to talk to the terminal AND to the modem.

Note that this is highly dependent on finding what you need. If, for instance, the printer port allows data to flow in only one direction, you are out of luck.

Once this is set up, there may still be problems -- namely, what to do if the terminal decides to intercept data from file transfers (i.e., the terminal reacts badly to the usually weird characters going back and forth between the "printer" and the modem)? Again, check the section/submenu for an "operating mode" (or something similar) for the printer. See if there is a selection which will cause the terminal to "monitor" the flow without actually interpreting it.

I guess that's just about it. If you have any more questions, feel free to ask.

3412. Memory Expansion Modules for the 800.

Source record: 109811

I would like to buy the following programs for the Atari 8-bit, but am having a lot o' trouble finding them. Any help would be appreciated!
M.U.L.E., Fantasyland 2041 A.D., The Nightmare (i.e., many of the CrystalWare games) and Dandy Dungeon (an old APX selection).
Of course, original copies with full docs in good condition are preferred. I will pay shipping/handling. If you have any of the above to sell, mail me and we'll work something out.
I also would like some of the old Compute! and ANALOG magazine programs. The disks I originally typed them in on have disintegrated over time. Any suggestions as to where I can pick them up without keying them in all over again are welcome.
Thanks for any help!

3414. MIO and Hard Drives

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-24 03:06:00 UTC
From: un035513@wvnvms.wvnet.edu
Message-ID: <1992Aug23.223937.3485@wvnvms.wvnet.edu>
Source record: 109812

OK. Now I'm back after 4 days of hanging 160 feet in the air from a bungee cord I have a couple of questions for the MIO users on the net. Esp. those who use hard drives. I just came across one myself recently and was wondering about what exactly I can hook up. I vaguely remember reading a review that stated that it could use a RLL/MFM w/ aplicable controler. I also remember that you could hook up a SCSI drive. This needs no controller, right? Just a case, power supply, and cables. If this is true then I'll be able to hook up a sweet little 42 Meg SCSI drive i found in Computer Shopper for $198.
Thanx in advance

Source record: 109813

Well, we seem to have some new readers of csa8, welcome.
I've posted how to get Quick a while ago, I guess I should repost
that message.
You must know Quick is a piece of German software, so it's more
difficult to purchase for American users than for Germans.

Therefore I've asked the distributor of Quick and S.A.M.
(Power per Post) about ordering and paying from abroad.

Here's what they anwsered:

1. you have to send your order to

Power per Post
Melanchthonstr. 75/1
Postfach 1640
W-7518 Bretten
GERMANY

you do not need to know the ordering numbers nor the price. Simply
write what you want. eg. Quick, S.A.M.
Mention the type of your computer.

2. then 'Power per Post' will send a reply telling how
much you have to pay.

3. go to your local bank and get an international money-order

4. send your money-order back to 'Power per Post'

5. wait for the stuff to come

Ok, I admit it's quite a lot of work, but that's the way they want
to handle it.

BTW: Bill, you said that you got in touch with PPP by yourself.
Did they gave you additional information about Quick and ordering?

Marek Tomczyk

> dataterminal... but my modem is usually attached to my RS-232 line. How
> would I now talk to my modem? Do I attach the modem to the dataterminal's

Well.. the way I've done it is hook up the 8-bit via SIO to my SX212 (it
has both an SIO port and an RS232 port.) From there, I connect the VT101
MONSTER to the RS232 port. If you could disconnect some pins here and
there (to keep echoing from happening), you could xfer data between an
RS232'd system and an Atari 8-bit with only one modem (but it HAS to be
the SX212, unfortunately.. It has only 1200 baud... UNfortunately...)

it was fun screwing with the working VT-101 that I got set up, but it
takes up SOO much room, and even tho it's convinient to have the 8-bit
running something other than a terminal while I'm online, it gets
confusing.

I'm glad I didn't spend any money ;)

Yes, I can believe that! I have been looking around a bit for a Lynx
and seeing what games are available... with almost none to be found!
Even the local Toy's R Us store does not carry the Lynx (though they
do stock a few of the cartridges). I also tried several mall toy
stores and even Sears! None! Gee, it makes it difficult to buy
Atari's wares when you can't get ahold of them.

Source record: 109816

To answer your question, yes you need a controller with a SCSI
drive but you NEED the drive WITHOUT the imbedded controller.
Just about all the new drives have imbedded controllers.
Last year I put a hard drive on my 1 meg MIO. Heres what I did.
I bought a used RLL 30meg HD Seagate ST238 (They still sell these
refurbished). (the drive cost me $75). Then I sent to CCS (Bob
Puff) and bought an Adaptec ACB-4070 RLL controller ($125). Bob sent
me the cables for $5. Then I bought an IBM minitower to house
this thing in...all the hardware, nuts, bolts everything came
with the minitower, 200w power supply and everything for $67.
(Now I'm putting 3 1/2" drives in thar too.) Everything just
plugs right in! On the disk I got with the MIO was the program
to format the drive and the only drive that has a PARK program
is on the disk too and it is for that RLL drive.
If you bought a MIO the docs on it and the controller are
invaluable! Follow these closely.

Quick is sold by Power Per Post of Germany. (Note: Quick doesn't run on
un-upgraded 1200xl's.. ie, you need the XL/XE Operating System to run
it).

The address on the disk says:

Power per Post
PF 1640
7518 Bretten

Tel. 07252/3058

Marek Tomyzck(sp?) was good enough to send me a copy of it.

BTW: The docs. are in German!

>
>Is there a reason that we here in the atari 8-bit newsgroup are
>NOT doing this on a regular basis and in a defined area??
>
>-jim

I think the reason is simply that there wouldn't be enough traffic.
Look at the Atari Archive FTP site. How many 8-bit uploads are there a
month? An average of maybe 3 or 4?

Granted not all, but MOST everybody reading this group can get at the
atari.archive either by FTP or by e-mail with BART. Those people that
can do nothing but read News are welcome to post binaries here, but
unfortunately cannot retrieve files from the Archive.

Combine this information with the fact that comp.sys.atari.8bit doubles
as the Info-Atari8 Digest mailing-list, where subscribers grumble when
their mailboxes overflow with oversized Digests containing huge binaries,
and hopefully you see why we use the atari.archive instead of a
comp.binaries group.

Well this really isn't any big news. Atari has been in deeep financial trouble for years and I don't think Jack Tramiel ever spent $40 million on advertising in his entire lifetime. As for the Jaguar, judging by the time it took them to launch the Falcon, we probably won't see any in the US until late '93. When they show up in Europe/elsewhere is anyone's guess. Only diehard Atari fans will care anyway, and it seems that's enough as far as Tramiel's are concerned. When a story like this runs in the US (as one did recently in Forbes Magazine) the rest of the computing world is usually surprized to find out that Atari still exists at all!

Joe:

My god! That was posted ages ago! I am trying to remember everything I
did - I don't use my 8-bit anymore, well I do use it as a dumb terminal
for debugging Windows apps, but that's another story.
From your description, it sound like you are using a single sided Percom
controller. There were two flavors of Percom drives available. Single sided
and double sided. The single sided version requires a change in the EPROM
on the control board that talks to the 1771(?) FDC chip. The EPROM contains
6809 code, the Microprocessor that is used on the card. The Double
sided controler knows about the second side of the disk but requires a new
crystal and a updated controller chip (WD1772 i think). Regarless of the
approach, neither of these solutions is trivial. (A 6809 cross assembler and
a machine to run such a beast on. I know of none for the 8-bit, and I hacked
a PD version for the PC to run on the ST.)

As far as the Parallel bus version: This is even more of an undertaking. To
do this you will need to program a PROM to talk to the BUS and to at the
very least tell the 130xe/65xe that there is a device on the BUS. Then you

must design a disk controller circuit that can talk to the drive and provide an interface to the BUS. Then you must write a device driver for the controller which must reside on the ROM also. This is how I interfaced to a 1.44 mb drive on my 8-bit. While disk controllers are straight forward to design - timeing is the biggest problem - today's technology actually makes it easier with one or two ICs need for the whole thing (my board had 20!) - unless you are familar with digital circuit design, this could be quite an undertaking. Also, you will need the specs on the Paralled bus and the 8-bit internals - ie Mapping the Atari. A EPROM programmer is a must and the MAC65 assembler cartridge for developing the code.

As far as me doing it for you... Well, and no offense intended, I get paid in the range of $100 to $150 per hour for my consulting business and if you could afford this you would be better off buy a new machine.

(STUFF DELETED)

The article I read - which I vageuly remember - documented the exact bytes in the EPROM memory that need to be changed. The bad news is that I sold all of my Atari stuff with the 130xe. Magazines and everything. You might post a message in the Atari Sig regarding this article, somebody must still have a copy and could possibly help.

One last note: e-mail me at aa596 and not ae302, as I rarelu log into this address.

When you run $E477 on an XL/XE computer, it will do a reboot.
I believe on the 400/800, it goes to the chalkboard.

(Rats! Where is my memory map?? Whoa! A funny! I forgot where I put
my memory map!!!!)

I am not talking about posting all of atari.archive here. I mean an
area LIKE comp.binaries.ibm.pc where an ocasional file comes by.

Oh well. As I can see, no one here seems interested in exchanging
binaries via usenet news. I think that is too bad. If there was a
group for the exchange of binaries, then those intersted could
participate (and it might even increase the stuff availaible at the
archives [because people would copy it to the archive], and those not
interested woulden't even have to look at the news group.

game GL> system, but there is no XE on it.
GL> Thanks a lot!

You can use any game cartridge labled for use on XL/XE systems, and you can use most of the cartridges labled for the Atari 400/800 systems (some of the 400/800 carts were programmed using direct access to routines in the OS ROM which was a no-no with Atari; when the OS was revised for the XL systems, these carts wouldn't work on them).
You cannot use carts from the 2600, 5200, or 7800 video game consoles on the XE game system.

Message-ID: <1992Aug26.180402.3717@rz.uni-karlsruhe.de>
Source record: 109831

Nope, you can't use cartridges for 2600, 7800 on your XE game system.
These two do come from Atari but they are entirely
different systems.

As far as I know, the XE game system is internally identical to
the XE home computers. You could take cartridges that run on
that system (800XE, 130XE).
Software for the XLs will run without problems (800XL, 600XL).

There are a lot of cartridges for it available second hand.
You could go for any cartridge designed for the Atari 8-bit
home computers, except for a few really old ones for the
Atari 400/800. Some of them need a translator to run (i.e. software
that replaces the XE operating system by the OS for 400/800s)

I know that Daemon Attack from Imagic requires the old operating system.

hope that helps

Marek

3435. MIO and Hard Drives.

Newsgroup: comp.sys.atari.8bit

Someone mentioned that you need to have a SCSI Drive WITHOUT the embedded controller for use with the MIO.... ICD's newest HD formatter (HDFMTPH9.COM) has an option for 'Seagate Embedded Drives'. I have never tried using a SCSI drive (I have an Adaptec 4000a) so I don't know if it works. HDFMTPH9 and HDFMTPH8 are both greatly improved HD formatters over those that were included with the MIO.

> the fire button down & using the keyboard. The copy cursors take some

Thanx.. I'll check it out. For now I've been using my specialized mapper
for crashman!... it lets me plot character-pairs on the screen in one
fell-swoop (or swell-foop), as well as moving the cursor around in two
character steps horizontally. Of course, this can be overridden, for mor
exact placement of objects and whatnot (say you had some crystals (like
coins)... they'd look like this: "<>".. in a 20 column screen, you could
only position them like this:
<>
<><><>
<><><><><>
but in the 40 column, paired-character setup that crashman! uses (like
Bros. used), you can do this:
<>
<><>
<><><>
it's not very important, but it's a nicety.. it gives the game a
different look than Bros.)

Also, another thing I did was make two dirt characters.. in Bros. and
Super Mario Bros., that same pattern gets monotanous... and with 40 col.
positioning and single-character placing modes you can make the dirt
pattern even more varied...

I'll check SCRNEDIT out tonite...

btw: I'll probably end up adding the Mapper to the registered version of
Crashman!... thanx bill

> ^^^^^^^^^^^^^^^^

Would some kind soul please expand on it ?
I have no ftp access but possibly can access via email from
my SPARC station PC

How would I get to the atari.archive using email with BART ? (what is it
anyway)? and even if I did - how would I transfer the binaries from the Sun
to the Atari 8 Bit ???

Sorry about this beginner question, but I have a feeling there are
also others who would like to know.

Thanks,

avi@imagen.com

3439. SpartaDos trashing directories!!!

3440. Fixing a 1050 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-26 21:22:30 UTC
From: Pat_Barron@transarc.com
Message-ID: <keazMKL0Bwx2M22_oZ@transarc.com>
Source record: 109836

[I just posted a similar note in comp.sys.atari, but this is probably a more suitable place....]

I have just aquired an Atari 800XL, with mods that make it look internally like a 130XE. Everything seems to work pretty well, except for the 1050 disk drive that came with the system. It appears to read and write things without much problem, but it can not format unformatted diskettes.

A drive RPM diagnostic I have run tells me that the drive is spinning too fast, yet I don't see any obvious way to adjust the speed. Can anyone tell me what I need to do?

Thanks,
--Pat.

Last night on GEnie, there was a RTC (round table conference) with the
designer/implementor of the GEnie/Inet gateway. I (and others) asked
about these issues and he said that they are delaying this access
until they check out some security problems [just to be sure that it
will work to _their_ standards, I believe.] They _do_ understand the
value, but you need to understand that Unix is not the safest OS in
the world, and just one security glitch could lose GE gobs of $$.

There should be a transcript of the entire night's conversation on
alt.bbs (maybe alt.bbs.internet?), but I'm not sure in which newsgroup
it will end up...

I needed some of these a month ago and posted a message looking for people who may have some spares laying around. I received several responses, so there are still people out there that might be able to help you. I'm assuming that you really only need one or two.

If you're interested in selling, you might want to contact bufort@remus.rutgers.edu. (I believe that is the person who started this thread.)

Of course, you can only use the standard cards to get up to 48K. If you need more than that, you need a card that is specially designed for that. (Actually, you can modify a standard 16K card to make a 256K card--I know of several people who have done it, but I don't have the information on how they did it. It takes a lot of soldering, the 256K chips, and I think a few cheap controller chips.)

Is anyone familiar with this upgrade technique? I suppose someone could start a business where people mail in a 16K card with $$$ and you send them back a 256K card.

Jim Hood says there might not be enough interest in posting binaries.
Well, I'm interested.
There are probably a lot of things that don't need to be uploaded to the archive, like ASP files for instance, but would be nice to have.
Games and applications, etcetera, belong in the archive for sure, but I like to see what other people produce with certain programs.
These auxilliary type files are, in my opinion, perfect for posting here.
Music files for AMP, AMS. Picture files for all the various art programs available for the 8-bit.
Anyone else feel this way?

3445. Atari stuff for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-27 00:48:42 UTC
From: dam1@ra.msstate.edu
Message-ID: <1992Aug27.004842.24619@ra.msstate.edu>
Source record: 109842

I have finally decided to sell my Atari 8-bit system,
it includes the following:

Hardware - 800XL with RAMBO XL (256K)
1050 Disk Drive with US Doubler & SpartaDOS 3.2d
1020 color pen plotter/printer
256K Multi I/O Board
ICD hard drive kit -- can include 1 or 2 20 meg hard drives

Accessories - 5 joysticks
2 track balls (1 good, 1 bad)
1 set of paddles
1 ICD printer cable
1 ICD modem cable

Software on cartridge - SpartaDOS X version 4.19
MAC/65
BASIC XE
The Writer's Tool

Software on disk - SpartaDOS Tool Kit
Bank Street Music Writer
Chipmunk
The Converter version 1.51
Paper Clip
Print Power
The Print Shop
RAMbrandt version 2.0

Games on cartridge - Asteroids
Dig Dug
Galaxian
Lode Runner
Qix
Robotron: 2084
Space Invaders
Star Raiders
Super Breakout

Games on disk - Access Triple Pack (Beach-Head, Beach-Head II,
Raid Over Moscow)
Alternate Reality - The City
Alternate Reality - The Dungeon
Artic Antics
ballblazer
Super Boulderdash

Boulderdash Construction Set
Chessmaster 2000
David's Midnight Magic
F-15 Strike Eagle
Hacker
Jawbreaker
Jewels of Darkness
Leaderboard Dual Pack
Lords of Conquest
Master of the Lamps
MRCA Mach 2
Pinball Construction Set
Quest of the Space Beagle (no docs)
Silicon Dreams
Tail of Beta Lyrae
Temple of Apshai Trilogy
Gateway to Apshai
Trail Blazer

Books - Basic Atari BASIC
De Re Atari
Mapping the Atari, revised version (includes XL stuff)
Programming the 6502

Magazines - ANALOG Computing issues #33, 34, 44-79 (8/85, 9/85, 7/86 - 12/89)
Antic: Jan, Feb, Mar, May, July, Aug/1985
May, June, Dec/1987
Feb, Apr, Nov, Dec/1988

Except as noted, all hardware is in great condition and all software
includes documentation.

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

3446. Re: GEnie To Internet

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-27 01:55:08 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92239.205508JJMCWILL@MTUS5.BITNET>
Source record: 109844

This note on Internet access.

This is taken from online help for the Michnet dial-in system.

Please note that in accordance with the wishes of Federal agencies
who control the backbone networks through which traffic to
the greater Internet must pass, we can allow access to those parts of
the Internet outside our own network from Hermes ports for which we
can identify the user. In practice, this means that users who have
dialed in or who are using workstations in public terminal clusters
cannot access Internet hosts outside of Michnet, without further
authorization.

I believe this could also be, in part, why the Cleveland Freenet requires
a signed statement from each user before granting them full access, including
e-mailing capability.

Maybe GEnie is approaching the Internet connection cautiosly for the same
reason. But it shouldn't cause any problems, GEnie users already have
unique user identifications. Hopefully we'll see all online services
eventually granting fuller access to the Internet, without all these
surcharges they insist on imposing.

Jeff

3447. Re: Memory Expansion Modules for the 800.

Newsgroup: comp.sys.atari.8bit

Message-ID: <92239.210218JJMCWILL@MTUS5.BITNET>
Source record: 109843

In regards to the 256K memory card expansion. I have an article in
a little booklet I got in '87 called Mods, Fixes, and Upgrades which
details this. I finally got a copy of the documentation out to Dan Nowicki
who had requested the information back when I was doing the Atari Classics
campaign. Well, better late than never anyhow.

Yes. I beLIEVE they said they would accept US cash.. I'd need to double
check. (all I'm worried about is that YOU will ;)). I have Harold
Schonfeld's e-mail address (he's one of the programmers of Quick).

It's: aohybrid@cnve.rrze.uni-erlangen.dbp.de

Please put the subject: "Letter to HS".

> ATARI XE? I once saw a cartridge for ATARI video game system, but there is no

Nope. Unless there is a device that will allow you to play 2600, 5200 or
7800 games on the XL/XE series that I'm unaware of! Every once in a
while somebody posts a list of Atari Classic software retailers (I've
gotta get mine worked on, don't I!? <gulp!>). A few of the best places
to contact for software are:

Best Electronics
2021 The Alameda, Ste.290
San Jose, CA 95126
Tel: 408/243-6950

B&C Computervisions
2730 Scott Blvd.
Santa Clara, CA 95050
Tel: 408/986-9960

American Techna-Vision
15338 Inverness St.
San Leandro, CA 94579
Tel: 1-800-551-9995 (outside CA)
510-352-3787 (in CA)

There are plenty more.

One note: Disks are often supported more than cartridges these days!
I suggest getting a disk drive (1050 or XF551) if you don't
already have one!

Message-ID: <Hqc6PB5w165w@cyberden.uucp>
Source record: 109847

It's sort of a given these days that Atari Corp. pretty much sucks.
IMHO, Atari Inc. was excellent, minus the fact that they were more or
less 90% video games and 10% computers. If they evened it out a bit,
things would be excellent these days! (Our REAL big brother would be the
Amiga, and it would probably be 8-bit compatible!... ah to dream)

To Samuel Pattons...
Sam, you asked me to tell you about messages I get. Unfourtunately my system
doesn't reckognize "cs.colostate.edu", so I stuck this message here..

Forwarded message (slightly cut) :

:) From: ab588@yfn.ysu.edu (joseph sabatino)
:) To: bruck@brachot.jct.ac.il
:) Subject: Re: Percom w/3-1/2" drives?
:) Reply-To: ab588@yfn.ysu.edu
:)
:) Yes, you can run 3 1/2" drives from a percom controller ONLY if
:) you have a percom double sided drive card. They can it both
:) flavors...single sided and double.
:) RFD-44s1 and AT88-SPD are the ones that you want. I know they
:) will format 360k but don't know about 720k.
:)
:) Joe Sabatino-->ab588@yfn.ysu.edu

I am certainly interested in this information. I've never heard of this
before, and I always thought the 800 was limited to about 52K max. I'm
pretty good with my soldering iron, but I lack the raw technical knowledge
to just hack away at my machine willy nilly.

If someone has this info in a text file, could they post it here?
Can programs actually "see" the 256K? (for example, Flight Simulator
II disk has a 48K version and a 64K version which loads depending on
your setup. I would really like to play the 64K version.)

> them...

JH>I am not talking about posting all of atari.archive here. I mean an
JH>area LIKE comp.binaries.ibm.pc where an ocasional file comes by.

JH>Oh well. As I can see, no one here seems interested in exchanging
JH>binaries via usenet news. I think that is too bad. If there was a
JH>group for the exchange of binaries, then those intersted could
JH>participate (and it might even increase the stuff availaible at the
JH>archives [because people would copy it to the archive], and those not
JH>interested woulden't even have to look at the news group.

Lets have a vote on this, I for one would be interested in a group
for ATARI 8 bit binaries. With the advent of OS/2 and other OS's the
amount of traffic generated in those BINARY groups are very large
compared to any significant traffic this new group would generate.

The trouble with this idea, and if its required, who would moderate it?

. DeLuxe./386 1.25 #1464s . This is your brain. This is your brain on DOS!

3455. Classic Atari Cartridges

Newsgroup: comp.sys.atari.8bit

Again, only minor changes and corrections mostly since the last post.
I guess this list has reached critical mass. Enjoy!

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 2.3

I am trying to compile a list of all cartridges released for the Atari
8-bit computers. I am organizing the list by catalog number as listed on
the outside of the cartridge, when available, and by manufacturer. A year
column holds the copyright date and/or release date of the cartridge.

Some of the list has been distilled from old magazine ads and reviews, and
may be subject to errors. Entries with question marks after them may not
exist in cartridge form, or worse, may not have been released at all.

I'd would like help completing this list. Comments, additions, and words
of encouragement are all appreciated, and will be noted in the contribrutors
list at the end of this post.

>until they check out some security problems [just to be sure that it
>will work to _their_ standards, I believe.] They _do_ understand the
>value, but you need to understand that Unix is not the safest OS in
>the world, and just one security glitch could lose GE gobs of $$.

Are you telling me that GEnie's computers run under UNIX? If they do
not, then what possible effect could any insecurities in a UNIX system
affect GEnie? Don't make the common mistake of assuming that the
Internet has anything at all to do with UNIX - the purists will bite
your head off! ;-)

I logged on GEnie and checked out the INTERNET beta-test section the other
night. It costs $9.95 EXTRA per month (effectively tripling the $4.95
monthly subscription fee) PLUS you get to pay $0.40 *per message*. I took
advantage of their feedback menu option and told them what I thought of
their pricing strategy. ;-)

I pointed out to them that Public Access UNIX systems everywhere offer
unlimited Internet mail for a couple of dollars per month. Many FIDOnet
BBSi offer internet mail for FREE. Even *Compu$teal* charges less for sending/
receiving Internet mail than GEnie does. Now, if CI$ charges less for a
service than you do, you KNOW you are overpriced. You'd think that GEnie
would have taken a hint from the massive outcry when Fraudigy started
charging per email message and avoided per-message charges like the
plague, but alas such was not the case.

I've been pulling for GEnie for a long time, ever since they started up
their Star*Services for a flat rate monthly fee. They have the potential
to be the BEST online service in terms of bang/buck. Based on what I've
seen of this Internet gateway setup, however, GEnie's going to blow this

BIGTIME if they don't wise up. :-(

3457. Re: Expanding a 400 to over 48K

Newsgroup: comp.sys.atari.8bit

Yes you can expand a 400 to over 48K the same as you can an 800, but keep in mind that the RAM over 48K is NOT the same as that on the 130XE. The best upgrade will be "Axlon" compatible which can be used as a RAM disk or is supported by a limited amount of software (SynCalc and SDX come to mind).

I've lost a disk or two to SD, but I'm not sure if it was me banging
hardware registers or SD. It happened when I had a disk nearly full &
a SAVE did me in. At the time I thought the problem was the save took up
all the free sectors & somehow a directory sector was either used out right
or SD tried to grab another sector to expand the directory & nothing was
left. I also had more then one disk's boot sectors go bad & get the famous;
"Unrecognized disk format" for that you just need to use a sector copier with
an intact SD disk & copy the 1 sector to the scrambled disk.

Why not try an alt.atari.8bit.binaries group? It's easier to get
started, and it would let us all see how successful a 8bit.binaries
group could be.

Well, after some experimenting, it only does it (so far) with
double denisty disks. (I have a US Doubled 1050).

Could the us doubler go bad? (I haven't tried Single density
Ultraspeed yet though)

With all this talk about the MIO and SCSI-embedded drives, I'm surprised
that nobody has mentioned the solution to the problem...

The Black Box from CSS will handle all types of SCSI drives, including
almost all of the newer-type drives with embedded SCSI controllers.
PLUS, they haven't abandoned the 8-bit market like ICD has.

You can request a free catalog from CSS by calling their offices at
(716) 429-5639 between 10am and 5pm Eastern time.

Man, that game drove me batty. Awesome game, but thirty minutes of careful
play were shot to hell by that infernal graveyard. I reached the fifth level
a dozen or so times, but could never get past it.

And did anyone ever finish Shamus? Case II was easy, but the first one
was ridiculous. Found a few bugs though.

>HDFMTPH9 and HDFMTPH8 are both greatly improved HD formatters over those
>that were included with the MIO.

Just to avoid confusion, if it's a SCSI drive, it has an embedded controller. MFM and RLL drives are the ones without embedded controllers, so for them you need a controller board in addition to the MIO or Black Box. And some SCSI drives will not work with the MIO because they can't handle 256 byte sectors, but the Black Box interface will work with those drives.

Send a message to atari@atari.archive.umich.edu with the word
help
on a line by itself. Getting the files from the Sun to the 8-bit is the
tricky part, unless you can arrange to connect the two of them by modem or
null-modem cable. If you have an MS-DOS compatible PC, and a true double-
density drive on the 8-bit, there are programs that allow the PC to read and
write Atari disks.

GT> grover@emunix.emich.edu (__)

Sorry, very few programs will actually be able to use more than the base 48K. The 16K difference between an 800 and an 800XL lies underneath the OS ROM. To get at it, you have to switch off the ROM during the VBI. The 800 does not have the capability of turning off the OS ROM. On the 800, everything beyond the base 48K must be banked switched just like the extra 64K in the 130XE, HOWEVER the banks do not switch at the same 16K range of addresses as the 130XE, so even if you have the extra memory you can't run software designed to take advantage of the 130XE. The best known memory expansion for the 800 is the Axlon expansion. Some older software such as SynCalc, and newer software such as SpartaDOS X can use Axlon compatible memory on the 800.

Yes you could very well be having problems with the USD chip. It has two
documented problems:
1- it runs hotter than the original Atari drive controller chip, make sure
the drive has a continuous flow of air to it (i.e., don't put the drive
under a shelf or something where the air doesn't move.
2- the chip legs are shorter than most IC's. Atari uses two socket types,
one is flat and causes few problems (other than #1 above), and the other
socket type has slight ridges. Due to the heat, if your USD is in one of
the ridged sockets, it will work its way loose, and you will have to
continually re-seat it. The easy solution is to buy a chip socket with a
flat top, plug this into the soldered in socket, then plug in the USD. The
cost is less than a buck.

The above solved all my problems with my USD 1050.

All in all, I'm glad I've been able to enjoy the Internet for a few years while it has been populated largely with intelligent people with something to say that's reasonably worth reading, because I expect that as CI$, Delphi, AOL, probably Prodigy eventually, etc., become capable of accessing the Internet, the Internet will fill and clog up with drivel and become a lot less useful. I hope I'm wrong, but this is really what I expect.

Re: transferring files from SPARCstation to Atari 8-bit

This should work:

* Acquire a copy of "mtools" for the SPARCstation; this is a public-domain set of routines that will allow the SPARCstation to read/write MS-DOS 3.5" floppy disks in the SPARCstation's built-in 3.5" drive. Use this capability to place your Atari 8-bit files onto MS-DOS 3.5" disk.

* Acquire the program "UTIL" from the Atari Archive; copy it, too, onto MS-DOS 3.5" disk. UTIL is a program for the PC which allows it to read/write true double-density AtariDOS 2.0 (e.g. MyDOS w/o subdirectories) disks.

* Acquire a PC that has a 3.5" drive AND a 5.25" drive. These seem to be getting scarcer, but I have one so maybe you can find one. Put the 3.5" disk containing UTIL (for the PC) and the downloaded Atari files, into the 3.5" drive. Put a true double-density AtariDOS 2.0 formatted disk into the 5.25" drive (formatting a "true double-density" disk in AtariDOS 2.0 format is left as an exercise for the reader; I'd sweat over it, myself, but I've done it so I know it's possible). Use UTIL to write the Atari files from the 3.5" PC disk to the 5.25" Atari disk.

* Use the 5.25" true double-density AtariDOS disk with any AtariDOS 2.0 compatible, true double-density-supporting DOS, to read and use the files on your Atari.

Caveats: UTIL is prone to misbehavior. Mtools isn't the easiest thing to use. UTIL only works on 360K PC drives.

I finally perfected a tiny BASIC program that acts as a terminal!

I'm wondering, however... is there any ML routine out there that will search/replace throughout a bit of memory (like a string... this is simply an INSTRing replace routine I need... can't use TBXL because SX handlers (all R: handlers?) and TBXL don't mix well..)

For now I'm having to PRINT the string out byte by byte, changing [^H]'s to [DELETE]'s.. and to speed it up (not to as fast as I want it, either!), I have to turn the ANTIC DMA off and then back on when the xmission is done.

Damn hard on the eyes, I say! ;) any help?
thanx...
bill

This is my first REAL posting to c.s.a.8 through News...

About UTIL:
It can write Binary/Ascii files on a SS/DD Mydos disk.
It can read the directory, and format a new disk.
It can also read Atari disks, but that is not recommended for the weak of heart... You have to create two disks containing carbon-copies of the disk you want to read. Then, when reading, you have to canstantly flip between them , since the IBM drive is horribly prone to even the slightest error on the disk.

I recommend getting Omnicom or Kermit-65 on the Atari and use Kermit or Xmodem (Omnicom only) between the sparc and the Atari, via modem.
My 2cents...

Ghostbusters... anyone get past the Marshmallow Man??
Quasimodo... I past the bells, and then it sez "Beyond the bells lies the greatest challenge of all... THE CASTLE WALL!!" And then I see a few sporadic frames, and my character becames those 4 pieces flying all around the screen, which means Game Over..
The pictures I see are pictures of the castle wall, and it lasts ~2 seconds, and I just see my character wiggling in the center of the screen, out of control... And then, he dies and I'm returned to the title screen. It has nothing to do w/ the # of men I have left.
The game is copied, so it might be a protection scheme... but I doubt it.

Source record: 109729

A few years ago (quite a few, I suppose) I bought a nifty XF551 drive
for my 800 when my discontinued 1050 died on me.

I did notice, though, that the XF drive is a bit incompatible with
some of my disks. For instance Flight Simulator II no longer loads
and gives some sort of memory error.

Is this an inherent problem with the new (!) drive, or are my disks
just damaged from the old faltering 1050?
(What would make the XF551 different, except for the plastic case?)

Personally I think it is a good idea. I have full Internet access
with FTP and all, but regardles to this it would be nice to have
a place where small programms could be placed.
Nearly all other comp.sys groups have its .binary section.
Why not here?
It wouldn't be a replacement for the archive at umich.edu but
just a nice supplement.

I have no idea how to set up a new Usenet group. I'm sure there
is someone who knows it :-)

Just my $0.02

I finally got around to sorting my old Antic(s) & I think it was June '85
that had an article on the 1030 modem & using Turbo Basic with an R: handler.
Apparently I was in error saying you needed to use a DOS with a lower memlo.
It works, but the Article said it's the TB Autorun.sys file that trashes the
handler so you can use TB's BRUN or BLOAD (whatever?) to load the hander
After TB is loaded.

From what I can tell, you need to post the idea to news.groups along
with any pertinent information about what exactly the group is intended
for and how it will be handled (moderated, unmoderated, etc..)

After that, people can argue and discuss good and bad points about
such a new newsgroup and a CFV (call for votes) is posted (at a pre-
determined and advertised time). Everyone and anyone with a net
account is allowed to vote. You need to have something like at least
100 YES votes (make new newsgroup) more than NO votes, or something.
(or maybe that's 2/3 YES votes, and at least 100 more YeES votes
than NO vote.)

Then you can submit the voters addresses and votes, along with request
for a new newsgroup to a certain address (that I fforget at the moment)
which will then process and generate the new newsgroup so it can be
used by the entire net.

I'm not sure if there are even 100 participating users on *this*
group, so it might be hard to come up with the 100 necessary YES
votes (or more if there is a big movement against).

Well, one idea that pops into my mind, speaking for myself, is that
with a direct Internet connection (telnet, for example) you now have
some little hacker sitting at a university somewhere who can repeatedly
attempt to get onto your account and run up your bill... not a good
situation. With a dial-up connection that costs $.25 each call (such
as with hermes.merit.edu) Mr. Hacker will soon go broke since he has
to pre-pay it.

Grover Thomas says there may not be even 100 users on *this* group.
Probably true. So, before we try to get a vote in news.group, let's take
a vote here. This will save us the embarrassment of losing out there in
front of the teeming masses.

Send your vote by email to: thester@nyx.cs.du.edu

Should we have an Atari 8-bit binaries group, yay or nay?

If you can't email me, then post here in such a way that it attracts
attention. P
Since no one else has volunteered for this task, I thought I would go
ahead with it.
Of course, I will post the results here too.

C> Chris Chiesa
C> Chris_F_Chiesa@cup.portal.com

Addendum: UTIL works fine for all READs on a 1.2meg PC drive, WRITES will also work fine if you FORMAT the disk on an Atari double density drive (e.g. USD 1050 or XF551) each time before you write data from the 1.2meg drive. I did this for a good couple years to move data between my Atari at home and PC at work.

GT> (What would make the XF551 different, except for the plastic case?)

You are correct about the XF551 being incompatible with some Atari
software. The old 810 & 1050 drives spun at a non-standard speed (288RPM?)
and the XF551 ran at a standard 300RPM (i.e., any off the shelf half height
360K drive will run with the XF551). Some software used the rotational
speed as part of their copy protection - including SubLogic's FS2.
I talked with the folks at SubLogic, and because Atari changed the drive
speed, they discontinued the disk version of FS2 for the Atari. I then
bitched at Atari and they sent me gratis a cartridge copy of FS2 which was
normally only available bundled with the XE Game System.
The faster rotational speed is also why the XF551 is slightly faster with
DOS 2.x and MYDOS.

There are a very few programs, like Flight Simulator II and, I think, Atari Planetarium, which use a copy protection system that checks the disk drive's RPM. This doesn't work on the XF551 because it runs at 300 RPM instead of 288 like earlier Atari drives. So, to run Flight Simulator, you either have to boot from a 1050 drive or find someone with a pirated copy. Of course, there's the Flight Simulator cartridge, but I hear it doesn't work with scenery disks.

Andy,

Speaking of the Hermes connection, I used Umich's dial out modems to
connect to a GEnie number local to Umich. It was the same, or similar
setup, .25 per call. But there were big problems trying to configure
the dialout modem for 8 bits rather than 7 bits. This made downloading
files impossible. Compuserve offers Kermit, which to my knowledge would solve
the problem, albeit for the price of HORRIBLY slow data throughput.
CIS also has a node directly accessable by any MERIT/Michnet user.
I believe it is "CIS" or "Compuserve" at the "HOST?" prompt. Have they
had any problems with Hacker's attempting to break into users' accounts?

Chris, the Falcon is a 16 mHz 68030 with a lot of enhancements, much improved pallet, digital signal processor, etc. It's target price is/was less then $1000. Unfortunately, I've talked with a local Atari dealer & he says the 1st ones will be PAL versions sent to Europe so..... ARRGHH!
Well, I guess there aren't enough outlets left in the US to introduce the thing here. From the specs I've heard, it allmost has me willing to break out the Master Charge.

3502. MIO and Hard Drives.

Newsgroup: comp.sys.atari.8bit

I think I should bring up a point here. Yes, ICD has abandoned us as has many other companies (mostly software), but I din't hear users crying about not buying software that still exists from these companies because they have abandoned us.

I feel that the "Don't get an MIO because ICD has abandoned us" is one of the lamest excuses for not getting a good piece of equipment I've ever heard!! All who seem to fall back on this more than likely have another thought which is, "If something happens to my MIO, how can I get it fixed?" I seriously doubt that ICD is the only company that can pick up a soddering iron or a volt/ohm meter and find out what is wrong with an MIO. The area I live in has got to have the SMALLEST Atari 8-bit user base that I'm aware of, but we can get an MIO fixed - WITHOUT ICD!

I just thought I'd mention that because farnkly, it's a lousy arguement not to consider an MIO, which is a great piece of equipment that was manufactured by a not-so-good company, but then again, the MIO sounds like it comes from the SAME group of people who gave us the good 'ol ATARI 8-BIT!!! Atari Co. Are we going to not continue with the 8-bit also because we've been abandoned by Atari Corp.? If not, the the same attitude should be taken about any of these other companies that have done the same thing.

From: thester@nyx.cs.du.edu
Message-ID: <1992Aug29.211459.20143@mnemosyne.cs.du.edu>
Source record: 109749

The votes for a binaries group have been coming in.
If you did not read my previous post concerning the creation of a binaries group for the 8-bit and that you should send your vote to me by email, do so now.
Send your vote (yes or no) to:
thester@nyx.cu.du.edu
If you can't send email, then post your vote here.
No voting twice either. <g>

To those of you that have sent your votes, you should have received a note acknowledging that. If you do not receive a note back, let me know.
That means I am not getting your mail for some reason.
(or I got your mail, but you didn't get mine)
Post here if that is the case. I read this group daily.

To all of you that have voted, thanks.
To those of you that haven't, do it now!
Everyone that uses this group needs to vote on this.

Uncle Fester

CB>The trouble with this idea, and if it is required, who would
CB>moderate it?

I can't see any reason to moderate this proposed group any more than the
alt.binaries groups. They're not moderated.
The only reason that I can foresee moderation coming into the picture, is
the posting of pirated programs.
This _could_ be a problem, but I don't think we want to shoot ourselves in
the foot doing that. I think the first person that did it, would be so
ostracized by the rest of us that it just won't happen. (fingers crossed)
Is there any other reason for a 'moderated' Atari 8-bit binaries group
that I don't know of?

3508. Phantom

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-30 19:14:58 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <NB4BqB3w165w@cyberden.uucp>
Source record: 109655

I just got a working copy of that game Phantom. (last night, actually. I was up at 3am unDiskComming the damned thing!).. It's a pretty good game. It looks like Gauntlet, has the object of Ghostbusters, and the most repetetive music I've ever heard! (next to Tetris on the GameBrat.) (the music is it's only bad point)

Very nice graphics. If Dandy or Gauntlet look anything at ALL like this, they'll become a must on my list!

BTW: Bob Woolley has been kind enough to send out a spare copy of Action! that he has!!! And is offering me a 1200xl OS upgrade (that means Quick will work!) and a RAM upgrade (he says 256k simms cost about $1!.. with that DDIII will work MARVELOUSLY!)... and all for minimal charges.

Damn you 8-bitters are kind souls! ;)

BTW: (mainly to Jeff McWilliams, but also anyone else interested) Bob said that the way HE does 1200xl OS upgrades is to use EPROMs. Rather than pull one of the 2 24-pin OS sockets and replace one with a 28-pin socket for the new OS (and the other spare could be used for built-in BASIC), he just EPROMs the OS onto two 24-pin chips and plugs 'em in. He said something about 800 OS being on them too, hence no more FIXXL'ing, just flipping the OS (how..!?!?) over to 800 mode when I need it.. (to play that game "Smush"..hehehe)

Anyways... it sounds really interesting. Most of what he says is beyond me, tho, but all I want is the comfort of having a nice operating system ;) (and being able to see the BIG Dem, the Das Omen demo, Fred and Mission Shark, and Quick...hehehehehe)

mm..... the one for the 8-bits (at least the one I have with the green
monster running around breathing fire and squashing things) says (c) 1988
Cognito. If it's truly pirated,, it's among very few (that I know of...
if any) on the BBS I got it from (not known to be a pirate board.. a
user group board for a matter of fact)

Is Cognito still around? (or Zeppelin Games, if they made it) BTW: The
same fellas (in the credits) made Zybex. It has no (c), date OR name
except of the authors.

If so and it is the game, I'd llike to purchase a legal copy (so I'll
have the instructions!... besides,I'd definitely pay for an AWESOME game
like that....)

Is this true with, say, an SX212 handler? I'm pretty positive I've tried
this! Maybe I could try loading it with an XIO 39, like I do in normal
BASIC. I dunno why I'm even worrying tho! I've got Quick (for my
disfunctional 1200xl!) and have Action! on the way... and I have Pascal.

Hell, I even have Delta-Drawing... too bad you cant load an R: handler
into that! hahah

damn!!! that just made me think of something!! if I recall the docs, CGS
does plotting/drawing like you would on a graph (the word escapes me)..
wouldnt doing it Turtle-style save data xfer?... instead of needing x,y
x,y for the two ends, just deg,len for the turn and the length. This
wont be a replacement, but it may come in handy.

Oh, all those turtle-style designs while online.. wow

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <eRNcqB10w165w@cyberden.uucp>
Source record: 109665

yeah...ANSI. I'm gonna start work on a SIMPLE SIMPLE SIMPLE ANSI
graphics editor. No text, just ANSI colored spaces. It'll work in
Graphics 11 mode (80 x 192 x 16.. with 8 pixel-high pixels to make it
look just like an 80 x 24 x 16 ANSI screen on them thar IBMs.)

I've just gotten interested in ANSI lately, with my BBS program being
able to so easily support it and all.

fun fun fun.
It'll be in either BASIC (probably) TurboBASIC XL (if I'm tempted) Quick
(NOT!..1200xl's not fixed yet) or Action!, if I get it soon enough.

Damn.. I'm workin too hard lately...
ugh

Message-ID: <1992Aug31.112615.12434@miavx1.acs.muohio.edu>
Source record: 109672

Well, with all this extra 8-bit equipment around, I was thinking of
trying to do some projects with them, ut the first thing I would like to
be able to do is to have a simple networking scheme, not requiring a
disk drive for each one.

What I was thinking of was using the catridge port, but I don't
know how feasible this is. With the 16k cartridges, there are two chips,
but 8kcatridges on have one ROM. What would happen if I would daisy
chain, with a ribbon cable that plug into the sockets on a cartridge
bewteen the 8bits? Would the RAM in the cart area show up as the same on
all machines? Would a change made by one machine show up in the address
space of the other machines? Sort of like shared memory, the 16kblock
where the carts go. Any suggestions?

(I'm asking here cause I remember a post by (Jeff Potter?) about
the new networking scheme they were devising on GEnie for a MidiMaze
like game.)

Thanks!!!

Bill,

Bob Woolley's method makes good sense. It's not hard to put an 800 OS on
EPROM, you run the Atari 800 OS every time you load the Translator.
As for flipping a switch to get the different Operating Systems,
you can either put two OS'es on one set of EPROMS and toggle the Most
significant address bit high, or stack two sets of EPROMS and toggle
the Chip enable pins on both chips.

3522. RGB on 800/XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-31 13:16:16 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.715266976@garbod20>
Source record: 109669

I came to think of this when I read about Jonathan Katz's problem
with colour on his Atari 800.

Has there ever been an 8-bit Atari computer with three independent
R/G/B outputs? (As opposed to composite video with the colours
mixed in one single signal with sync.)

I've always assumed that the CTIA/GTIA delivers the composite
video on a single pin.

The screen quality is highly improved on an Atari ST or Amiga
if the computer is connected to a TV set via R/G/B instead of
composite video or antenna/RF.

It would be nice to get a clearer picture, even if the improvement
would reveal how blocky some graphics modes on the 8-bit Atari are.

I agree. There is really no need to moderate the group. I also
participate in the comp.binaries.ibm.pc group, and there are generally
fewer than 5 posts in there a week. Some weeks there are no posts.
Anyway... if that was an issue, i'd be willing to moderate it if no one
else wants to. (I'd rather not moderate), but it is really not a big
deal.

3525. Re: RGB on 800/XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-31 15:26:06 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <65002@cup.portal.com>
Source record: 109670

The color comes out on one pin of GTIA. I seem to recall an old article in Byte Magazine about using the GTIA's 4 lum outputs on a RGB monitor, but you had to do all your own screen output routines 'cause intensity was now color. Not sure, but I thinnk either National Semiconductor or Motorola has a composite to RGB chip. Never fooled around much with the video myself. It's Probably not a bad idea since composite monitors are getting harder to find & CGA monitors are everywhere. IMHO: Since the Byte thing didn't catch on, people probably want compatability with existing stuff over just being able to hook something up => Atari's stock output=> convertor (<$10) => IBM monitor.
Anyway, if you just want where the sync, color, & lum signals come out so you can fool around, let me know & I'll get you the pin-outs.

3526. XEP80 and Monitor.

3528. Terminal emulator help, please

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-31 17:15:24 UTC
From: phile@pwcs.stpaul.gov
Message-ID: <9208311715.AA12968@pwcs.StPaul.GOV>
Source record: 109676

I am trying to dial up to my account at work from home.

At home I am using an Atari 800 with an SX212 modem
running SX Express software.

At work I have a Unix account running on Sun hardware. At work I telnet to the
Sun from a Macintosh IIsi. The Unix account is set for a vt100 terminal. My
Sysop tells me that Unix supports lots of different terminals, but since he has
no Atari experience, he does not know what to specify.

When I dial up and try to work in ELM, the mail handler we use, I get lots of
extra characters, stuff like:
[K[?1l>
[?1l>[?1h=
[K

When I try to display the elm menu, the blank lines all have
[K at the left side of the screen.

Here is what my Sysop tells me about this:

>These characters are all sequences of ANSI command sequences that are
>supposed to perform various functions on the terminal. For example,
>ESC[2J will erase a screen, ESC[K will erase a line, etc. (The ESC
>stands for the escape character, decimal 27)

>So, since your program obviously doesn't understand these special sequences,
>since it is displaying instead of interpreting them as commands, it is even
>dumber than a vt100 type terminal.

So, does Unix support a terminal this dumb?
What do I tell Unix to do with TERM?
Or do I have to do something at the Atari end?

Please respond to me via Email at phile@pwcs.stpaul.gov, as I generally do not
read newsgroups.

Thanks for all your help!

I've just requested two files (and received them) from the Atari
archives at umich.edu. Problem is this: One file (raindemo.arc) came to
me in several parts (about 4, I believe). I had the system send them to
me, received them to hard drive on my Atari 800xl. Now, how do I turn
those 4 parts into one functional .arc file? Running Yau.com, it tells
me, cant read header (or something of that nature). Do I need to /a
append the 4 files to one another in sequence - thereby creating ONE
file (out of 4), then run Yau.com on them? Any help appreciated. I'd
like to know the exact procedure for receiving files via the archives to
my atari. Thanks!

3530. Re: Atari binaries postings. A comment...

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-31 17:54:13 UTC
From: garold@cbnewsk.cb.att.com
Message-ID: <1992Aug31.175413.20955@cbnewsk.cb.att.com>
Source record: 109674

I am in favor of having binaries posted for the following reasons:

- more convenient than ftp'ing somewhere
- new binaries and updates come right across the screen
(don't have to ftp to there and figure out what is new
or decide if you are interested)
- more convenient for people to post binaries (hopefully
more binaries will be posted)

However, is it necessary to have a separate binaries news group. It used to be common for binaries to be posted right to this group. I am not against a binary news group if it will get binaries posted but is there a reason why binaries can not be posted here.

Thank you,
Garold Redenbaugh

I think you have a good point. Why don't we just post uuencoded files here for now. If it becomes a problem, then we will have a much better argument for a new group. As it is, I'm not convinced that a new group is needed.

BTW: Will people have trouble accessing uuencoded files? I won't have any problem, but then again, I'm using a Unix box to do my transfers.

>>frustrating* to play for three hours and then lose 30 lives in the last
>>four rows.

Yes.

>Speaking of unfinished 8-bit games, did anybody ever get past the last
>graveyard in Necromancer? Some friends and I tried for years, but never
>managed to do it. It's a great game, but I'd rather eat my own intestines
>than have to play it again...

Yes.

Of course, I had to hack the games a bit :-) so that you couldn't die, or
had infinite lives, or were immune to enemy shots, etc.

In Pastfinder, after you complete each stage, you get a new "ranking". The
last "ranking" says "YOU ARE GREAT" and it doesn't change after that.
(BTW, IMHO, Pastfinder has some of the best character graphics and animation
I've ever seen. Very creative 3-D effects!)

In Necromancer, after you complete the last graveyard, you get a not-
too spectacular screen with horizontal bars of color flowing up and down
from the center of the screen with a powerful fading musical chord in the
background. Then you are returned to the title screen.

In article <9208281058.AA01063@brachot.jct.ac.il> bruck@BRACHOT.JCT.AC.IL (Itay Chamie1)
writes:
>Ghostbusters... anyone get past the Marshmallow Man??

Yes; you get a vertical scrolling view of the building, then see your men
stationed at the top of the building closing the gateway to the netherworld
with their beams. The game then continues as usual, with you getting some
large sum of money for 'winning'.

>Quasimodo...

Never heard of this game, unfortunately.

I think someone asked about Shamus. The last room has 2 vertical bars with a gap scrolling vertically (as with many other rooms in Shamus), and between the 2 bars lies the shadow. When you shoot through the gap and hit the shadow, a rainbow of horizontal lines, scrolling downward, fills the screen, and the message "Congratulations... but now it gets REAL HARD!" appears (or some similar message). You then continue on the next level of the game, back in room 1.

Any other games anyone is curious about? I've completed a few other games (in similar fashion) in case anyone's dying to know the ending to a particular game.

Source record: 109679

atari did not release anything to the public domain here in the
US of A....they didn't do anything here
to raise the popularity of the computer except rely on the users
to advertise.
You can't use an XEP80 on a tv set...I have it on a Magnavox
RGB Display 80 monitor the other one is on a Magnavox green screen
80 col Monitor. (I have 2) There is a mod to hook it up to a TTY
monitor also. Not all monitors will display the XEP80s output...
I know cuz I had one (forgot the name and got rid of it in less than
24 hours) that would not.

From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.07o7@abcd.Houghton.MI.US>
Source record: 109684

Good luck with your project to write an ANSI color screen driver for the 8bit. I am not doubting that it can be done, but I *AM* doubting that an 80 column color screen will be very readable.

There is a PD comm program called TERM80 that uses software only drivers to create an 80 column screen - it runs in either ATASCII or straight ASCII (TTY) modes. It looked *great* on my composite monochrome monitor - but was VERY difficult to read on my 14" composite color monitor - if I put the image on my 20" color TV (monitor quality), it was just bearable from across the room, but would still give me a headache trying to read much from it. Even a B&W TV didn't do the job.

BTW, there is a companion program to TERM80 called READ80 which allows you to read all those 80 character ASCII text files from the screen instead of dumping them to the printer. Same quality as above.

I'll take it either way. If we can justify a separate newsgroup, fine. If not, post 'em here. They would be a bit easier to deal with in a separate group, but if they are few and far between they might just as well be here.

As for problems with uuencoded files, I receive them via an SMTP gateway to the Tandem network, which is not Unix, MS-DOS, or Atari. I'm sure few of you have heard of the Guardian 90 opeating system. Anyhoo, from there I IXF to my MS-DOS PC, copy to a 3.5-inch floppy, take the file home to my ST, uudecode with Steve Yelvington's UUCODER.PRG, and use Xformer to get it over to the $ machine. There are probably as many ways of capturing uuencoded files out there as there are 8-bitters interested in doing so.

How do YOU uudecode and xfer to your $ Atari?

It shouldn't be a problem for most people. There are uuencode/uudecode programs for the 8-bit. I know there is a version of uudecode written in Atari Basic. I'm not sure if I have a copy, but someone here probably does if it's needed. If I may make a suggestion: When you post a binary file, start the subject with the word BINARY:, and that way people who don't want binary files can use a kill file.

It all depends where the handler loads before it relocates itself into low
memory. I don't remember exactly where LOMEM is with Turbobasic loaded,
but I think it's somewhere above $4000.

3539. ATARI BINARIES POSTING

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 02:57:00 UTC
From: charles.berlinguette@outlan.ersys.edmonton.ab.ca
Message-ID: <1461.78.uupcb@outlan.ersys.edmonton.ab.ca>
Source record: 109612

With regard to binaries posting, I'd like to see a separate group formed, the software I use to access this group has severe short comings and the UUENCODED files would come across as jibberish unless a seperate group is formed.

Nuff said.

>create an 80 column screen - it runs in either ATASCII or straight ASCII

Speaking of Ansi... The author of AnsiTerm has jus released version 1.0
of AnsiTerm. This version now supports xmodem transfer, screen dump and
capture and key board macros. It's somewhat slow, works best at 1200 bd
and does not support color. If there is any interest, I'll send it to
the Archives. If you don't have ftp access and want a copy, drop me a
note and I'll send you a copy.

Mike...

Get a hold of V10Squared and Kermit from the FTP site. V10Squared gives you (almost) 100% VT100 compatibility. I use it all the time to connect to the schools VMS system. The 80 column display works fine on my B/W TV, although if your using a colour monitor is might be a bit blurry. Kermit allows (slow) file transfers. Which leads me to another question entirly: Is there a Z-modem prog for the 8bits??????

Page # 001

TEDIT - A Text Editor

Byran P. Shappel (c) 1986 ANALOG Computing
doc.ver.2.0 by Bill Kendrick, 1992

Here's most of what can be done with this pbPgram. It lacks
block cut/paste/copy/delete and the ability to change the left margin
to 0. At least nobody seems to know how (yet).

(NOTE: I have a 1200xl and can use the [Func] keys, so I added their
uses)
Unlike doc.ver.1.5, 2.0 is catagorized by key commands, rather
than command types (ie- all [CTRL] commands are in one place and all
[SHFT] in another, rather than all Editing commands in one place and
all Cursor commands in another.) BTW: I wrote this using TEDIT.

[START]-(hold) allows most [CTRL] characters to be used
[F2]-See [CTRL]+[K]
[F3]-See load file ([CTRL]+[L])
[F4]-print to device ([CTRL]+[M])
[INVERSE]-inverse video mode
[TAB]-5 spaces
[SHFT] (hold) commands:
[DEL]-delete a line
[INS]-insert many spaces
[CTRL] (hold) commands:
[A]-beginning of line
[B]-bottom of file
[C]-clear memory
[D]-down 1 screen
[E]-erase spaces til next word
[F]-find (and replace) (use [SELECT]+[TAB] for [RET])
[H]-top of screen
[I]-toggle insert/replace mode
[K]-character caps toggle
[L]-load file
[M]-print to device
[N]-word count
[O]-toggle alignment dots
[P]-print file
[Q]-quit to DOS
[R]-switch current char.w/ next char.
[S]-save file
[T]-top of file
```

[U]-up 1 screen
[W]-move to beginning of next word
[X]-disk directory
[Z]-end of line
[arrow]-move cursor
[DEL]-delete current char.
[INS]-insert a space
[CAP]-see [CTRL]+[K]
[F1]-lock/unlock keyboard
[F2]-blank screen
[F3]-toggle insert/replace mode ([CTRL]+[I])
[F4]-turn on Atari character set (not toggling)

3543. T:Edit Docs. ver.2.0 <blurb>

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 05:55:05 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <imReqB2w165w@cyberden.uucp>
Source record: 109690

THat last post was of the new docs to T:Edit. I came across an error or two (not to mention the fact that the docs. that came with the ARC (Itay forwarded me a copy of T:Edit from the archive) used [^J]s rather than character$ 155's (ATASCII CR's) or [^M]s! (ASCII CR's)...what a screwed up printout i got!!!) I also tried the [F-] keys with T:Edit, and it may have happened by chance, or it may have been programmed in, but the [F-] keys have functions (nothing unavailable on a function-keyless 8-bit, but still mentionable, right?)

Anyways, has anyone come across a way to change the left-margin (which is set to 2 rather than 0! ugh!) or any way to block-cut bits of text... or use ALL the ATASCII characters? (like the arrows, [esc], etc.)

thanx..

ya know... i feel like a hypocrite, but... maybe we DO need a c.s.a.8.binaries....?.... (now that I've come across something to post, ya see....)

i stilll have the right to change my mind, right? ;) (left?)

Yes, I, too, would like to emulate a VT100 term with my Atari 800.

If anyone can suggest suitable programs, please e-mail me also,
or post here, as I do read this group frequently.

Thanks in advance, trr

3545. Re: Networking 8bits with the cartridge port.

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 13:17:32 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.07qb@abcd.Houghton.MI.US>
Source record: 109697

A firm in Warren, Michigan, USA called Innovative Concepts produced a scheme using a 400/800 connected to a XL/XE via the cartridge port. The RAM in the 400/800 could be used for either a printer buffer or a RAM disk. Once upon a time (isn't that how all fairy tales begin), ICD was to release a special ROM for the MIO to permit true networking. (I suspect that the chip would allow the MIO to have different SCSI addresses)

On the other hand, it is easily possible to setup a simple device to allow two 8bit systems to share all the SIO peripherals. All SIO lines are in parallel except for the +5VDC and COMMAND. +5VDC can only be connected to ONE computer (the master) and the COMMAND line is hooked to both via a single throw, double pole toggle switch. The master computer must be on at all times - the slave computer can be on or off as desired. The switch is toggled to allow one or the other computer access to the SIO bus - but only one computer is allowed access at the same time. I built a small box with a couple SIO jacks and an SIO plug and the switch for about $25 - the most expensive parts were the SIO connectors. It worked great - I would let the kids load a game from the floppy drive on their 800 while I continued to work on my 320XE - when I needed the floppy (I typically only used my hard drive) or the printer, I flipped the switch and used them.

Source record: 109696

In North America the XEP80 outputs a monochrome composite video signal with the NTSC standard - I assume that Atari marketed a PAL version in Europe. By the way, don't waste your time hooking a XEP80 to a composite color monitor. The signal will smear so badly that the characters will likely be illegible.

The most disappointing end-screen I've ever seen was for Caverns of Mars.
After WEEKS of playing the stupid thing over and over and over, I finally
finished the hardest mission and... got the score list, just like if I'd
died. NOTHING special. I don't need half-hour animated movies and I played
the game because I enjoyed it, not because I just wanted to see the end
sequence, but games that have endings should have ENDINGS -- something,
anything. Even text wrapping up the story line. After weeks of enjoying
Caverns, I felt let down after I'd finished it...

But if the TV set has a composite video input, Fredrik mentions
the SCART connector in his original article, wouldn't the TV
work with an XEP80?

I mean, the Atari ST and the Amiga both display 640x200
pixel modes on TV sets, this resolution approximately
corresponds to the 80x25 character mode in the XEP80. I
don't think older colour monitors (for Atari 800, C64 etc)
are different from TV sets with R/G/B and composite video
input.

>here for now. If it becomes a problem, then we will have a much better
>argument for a new group. As it is, I'm not convinced that a new group is
>needed.

Imagine reading the Info-Atari8 Digest at, say, 300 bps, with say, a
1500-line .uue file in the middle of it. Do you think you'd watch the
binary go by so you could read the messages at the end of the Digest?
Info-Atari8 subscribers have no way to just skip over .uue postings they
don't want to read, they have to either watch the whole binary go by, or
they miss some of the other postings to the group. This was the reason
we've fairly successfully moved our file sharing from this group to the
archive. The proposed binaries newsgroup would indeed be accessable to all
Usenet readers, but the readers of this group without Usenet access would
not be able to make use of it. Perhaps a new idea: why not have the
proposed binaries group available as a separate mail-list as well?

>like to know the exact procedure for receiving files via the archives to
>my atari. Thanks!

That's just about right. Note that Uudecoders do not like any junk text
in the middle of the file, so when you combine your four parts
you have to go in with a text editor to fit them together into a single
pure .uue file.

Wellllll, on my Unix box I have a command a friend wrote especially for
me... called uuindecode, in C..
I might be able to get the sources..
The program works great, and is meant to handle
such cases.
Atari Archive does this to minimize congestion on the poor Net..
Anyone interested? Shall I try and dig up the sources so other people can use
this?
I'll try, anyway...

(sorry the mesg was a bit of a mess...)

re: info-atari-8 readers:
NO! The Digest has less messages if there is one big one, since
the digest completes itself after ~600 lines. Which means that a reader
can just stop reading it, since there is nothing after it. Of course,
there is an exception if it a shortish file... (~300)

That reminds me! I'd better work on it, eh? hahah... I've been fascinated with what I'm doing in PURE BASIC with a BBS (ie- no "by me" ML routines. Just the typical "move bytes" and "load bytes" quickies that I always use (in BASIC... I'd just MOVE or BGET in TBXL)). Hell, I even have a GOSUB'd routine called "OS" which checks for system halt [BREAK] disabled, [HELP] is checked instead), updates the clock, etc. All on my nifty custom DL (non scrolling data lines at the top..first time i got something like that WORKING correctly!)...

but yeah... I'm still waiting to get the music (Marek!? jk.. no rush), and add enemy movement.. You also gotta remember the work invovled in designing and testing each level! (PD version will come out much sooner than registered version!)

Also, I got school to worry about starting next week! (yeah, 5 1-hour classes... one of which is typing... another is yearbook... <yawn>... call it Club Med, but... hehhehee)

Thanx for the interest! I guess I know I have at least ONE order coming! ;)

3555. AMODEM 7.52!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 17:40:12 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <P0NFqB4w165w@cyberden.uucp>
Source record: 109606

Yikes... damn.. AMODEM really IS "BobTerm, but in BASIC"!!! (I got version 4.something from the archive, and version 7.52 from a BBS last night. It was described as "having all the features as BobTerm, but in BASIC"... which, amazingly enough, it DOES! I wish I would've gotten this long ago instead of version 4.x!! I used some of the routines in 4.x as a base for my modem-using programs. It's not a bad start, but like I posted earlier, I had to make a GOSUB'd routine to handle all the "all the time" things (clock, chat mode, etc) and then jump to it all the time! AMODEM has an ML routine doing it!

One drawback though... I (legally) can't use much from v.7.52 because it's NOT PD... So I guess I made that clock handler before i got it! haha...

Anyways.. for a good hack, i recommend AMODEM 7.52(or higher...!?)

I'll (evENTUALLY) see if I can upload it to the archive (to get that place up to date! ;))..

oh, one more drawback.... using MyDOS 4.53/4, BASIC (rev.C?), SX Handler (by Trent Dudley...same guy I beleive..?), (and with Hyper E: v.2 installed.. it takes a K or 2), it only has a 2K buffer!!!!!!!!!!!!!!!!

** Wanted: Used/new Atari 2600/5200/7800 games, Intellivision,Colecivision **
** and XEGS/Atari computer cartridge games. Will trade new/used/rare **
** games or buy games. **

Wanted: Atari 7800/5200/2600/8-bit computer, Intellivision, and Colecovision
video game cartridges. I would like to trade/buy/sell games. I have some
new and used games for those systems and would like to trade for games
that I do not have. I will also sell games (both new and used).

I will also pay a reasonable price for the games (depends on the game) and
pay shipping if you do not wish to trade. I will also buy games in sets
with the hardware if you are trying to get rid of an old system.

Please send me a list of the games that you would like to trade/sell and
what games you want in trade or the prices of the games you are selling.

Here is a list of the games that I have available for trade/sale for
2600/5200/7800,Intellivision, and Colecovision games. If you are interested in
trading, ask and I can send you an up-to-date (basically) list of what I have
extras of. I also have a few rare titles for trade only.

New Atari 7800 games for trade/sale: (All by Atari)

------------------------------------
Ballblazer ($10) Tower Toppler ($20) Donkey Kong ($10)
Donkey Kong Jr. ($10) Joust ($10) Dark Chambers ($18)
Pole Position II ($6) Asteroids ($12) One-on-One Basketball ($10)
Robotron: 2084 ($10) Crossbow ($16) Touchdown Football ($18)
Xevious ($10) Choplifter ($18) Karateka ($18)
Dig-Dug ($8) Hat Trick ($12) Realsports Baseball ($18)
Jinks ($16) Galaga ($10) Impossible Mission ($28)
Food Fight ($10) Barnyard Blaster ($16) (light gun required)
Centipede ($12) Fight Night ($16) Ace of Aces ($24)

New Atari 2600 games for trade/sale: (All by Atari, except Starpath SC)

------------------------------------
----------> Starpath Super Charger with Games 1-4 <---------- ($35) -----------
Desert Falcon ($12) Gravitar ($24) Pole Position ($8) Venture ($10)
Sprint Master ($16) Super Football ($12) Jungle Hunt ($14) Centipede ($16)
Crossbow ($18) Crystal Castles ($12) Super Breakout($12)Battlezone ($14)
Jr. Pac-Man ($12) Solaris ($8) Kangaroo ($10) R.S. V-ball($12)
Secret Quest ($24) Space Invaders ($12) Asteroids ($14) Ms.Pac-Man ($18)
Vanguard ($20) Dark Chambers ($20)

New XEGS games for trade/sale: (All by Atari)

-----------------------------
```

Rescue on Fractalus ($24) Archon ($32) Ball Blazer ($24)
Gato ($36) Barnyard Blaster ($36)

*** Note: Some of the new games may be out of stock and unavailable.
*** Some of the used games may have already been sold/traded.

Wondering why the prices are so high? -- Well, I spend quite a lot of time searching for these cartridges. My goal is to collect as many different cartridges for the above systems as possible. So, I greatly prefer to trade for games rather than sell them. When I sell them, I have to in some way justify all of the time I have put into finding that cartridge, that means I have to charge more $$$. If I trade for another cartridge(s) that I do not have, then I consider it even and I am happy.

Postage: Postage included when buying games and trading games (Except Intellivision games and all hardware).

Haggeling: Feel free. If you are buying multiple games, the chances are that I can give you a better deal than what is listed above. If you are just buying one. It's very unlikely.

Partial list if Atari 2600 USED games for trade (no manual/box):

Taz Swordquest: Water World Star Wars: TAG
Tunnel Runner Steeplechase Stellar Track Millipede
Krull Super Cobra Mario Bros. Basic Prog.
Dolphin Radar Lock (Many more....)

Partial list if Atari 5200 USED games for trade (no manual/box):

Miner 2049er Star Wars: The Arcade Game (Many more....)

Used Hardware for Trade/Sale (Shipping not included)

Systems:
Atari 2600, 2 Joysticks, 1 set of Paddles, Power Supply, Switch box, $25
Parts:
Atari 2600 (6 switch) Console only, $35
Atari 2600A (4 switch) Console only, $15
Atari 2600 power supply, $10
Atari 5200, 4 port model, Power Supply, Switchbox, $45 (No joysticks)
Atari 5200, 4 joystick port, console only, $10 (not sure if it works)
Atari 7800 Console only, $25

Used Super Nintendo games available for trade only

PilotWings R.P.M. Racing Super Ghouls and Ghosts

I am also interested in used video game hardware. Please also send a list of what you have and the prices.

Here is a PARTIAL list of the games that I am looking for. If you have any of these games for sale/trade, please write back and we can make a deal.

But since this is just a partial list, if you are interested in trading at all please write and I can send you the whole list.

Atari 2600 games wanted:

3558. Re: Networking 8bits with the cartridge port

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 21:31:24 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Sep1.163124.12469@miavx1.acs.muohio.edu>
Source record: 109703

[This is from Jeff Potter. He accidently sent it as a mail message
instead of posting it.]

In article <1992Aug31.112615.12434@miavx1.acs.muohio.edu> you write:
|>
|> Well, with all this extra 8-bit equipment around, I was thinking of
|> trying to do some projects with them, ut the first thing I would like to
|> be able to do is to have a simple networking scheme, not requiring a
|> disk drive for each one.
|>

The networking scheme you seem to describe sounds a lot like The Multiplexer
offered by Computer Software Services (CSS). It consists of a collection
of cartridge interface boards, allowing up to 8 Ataris to access the same
drives and printers, and to talk to each other. Drop a line to Bob Puff
or Chris Freemesser (sp?) for more info.

BTW: the "Maze of Agdagon" networking scheme is not based on this device.

Also: Jeff McWilliams: the "OS in EPROMs selected by switch" idea sounds a
lot like the US+ OS Upgrade also by CSS. The upgrade gives an XL/XE the
old 800 OS, the XL OS, or a third OS which allows Ultra Speed serial I/O
(with the proper disk drive) and bunches of keyboard-controlled modes.
Works real nice, too....

> Once upon a time (isn't that how all fairy tales begin), ICD was to release
> a special ROM for the MIO to permit true networking. (I suspect that the
> chip would allow the MIO to have different SCSI addresses)

What I think would be grand is a cheap networking scheme,
unfortunately, I don't think there is a practical way of implementing it
though.

The reason I would like to see one is that I now have 3 800XLs and
a 400, but only two drives. (But I don't have the money to buy the
multiplexer from CSS, I am a poor college student! :-( )

3560. Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 21:41:08 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GO9Z8M7HHE8Y5BXE@carleton.edu>
Source record: 109607

```
New for this release:

- I'm now recommending archive uploads be sent to
weiner@atari.archive.umich.edu as the BART help file says.
- Cleveland Free-Net Atari SIG info tweaked again
- Atari 8-bit hardware list added to, but still needs help

The 8-bit Atari
Frequently-Asked Questions List
for the Internet

Posted on or about the first of the month, simultaneously to:

the Usenet newsgroup
comp.sys.atari.8bit

and

the Internet mail-list
Info-Atari8 Digest

which are, in fact, one and the same group.

Revised 1-Sep-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. All
postings to comp.sys.atari.8bit automatically appear in the Internet's
Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. All
contributions to the Info-Atari8 Digest automatically appear on Usenet's
comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send
e-mail to Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
```

Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively. To have Z*Mag delivered "right to your own mail box," send a message

to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/djg/issueX.arc' where X is the number of the issue desired.
To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{107,110}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and
developers which is too long to include here. Contact him at
wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that
is common in the IBM-PC/MS-DOS world. This is done to make the file shorter,
so it takes less time to transfer between computers. The atari.archive
contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion
program is called superarc.arc (use supunarc.com to un-arc it). Each is
compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is
uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER
it into Atari BASIC). The file yau.arc contains yau.com, a machine-language
UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible
with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are no fewer than 5 programs at the atari.archive that claim to
achieve this, at least to some extent. They are:
pcxfer.arc - Predecessor of all but sr.arc. No recent usage reports.
util.arc - Perhaps the most widely used; archaic instructions, but works.
dskutil.arc - Reputed to be a cleaned-up util.arc.
atario21.arc - Also an improved util.arc, but only read, no write.
sr.arc - Stands for Sparta Read, for SpartaDOS format disks.
Each of these programs runs on an MS-DOS type of computer. For disks written
on your PC to be read on your 8-bit Atari, you must have an Atari disk drive
capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT
or equivalents, but not an unmodified 1050 or 810. There is no way to write

128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, unique OS
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
65XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (2 versions, see the Best catalog)
810 Disk Drive (SS/SD 90K with DOS 1 or DOS 2.0S)
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports)

1010 Program Recorder
1020 Printer/Plotter (40 col.)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (??? - never sold in U.S.)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with ???software)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware:
815 2 x SS/DD 180K with DOS 2.0D
1400XL 800XL plus modem, speech synth.
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
???Those two thermal XE printers - "one prints in color!"

End of FAQ list.

3561. MYDOS 4.53/4 (was Re: AMODEM 7.52!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 22:55:01 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.715388101@vincent2.iastate.edu>
Source record: 109608

In <P0NFqB4w165w@cyberden.uucp> moon!cyberden!phbill@well.sf.ca.us writes:

>oh, one more drawback.... using MyDOS 4.53/4, BASIC (rev.C?), SX Handler
>(by Trent Dudley...same guy I beleive..?), (and with Hyper E: v.2
>installed.. it takes a K or 2), it only has a 2K buffer!!!!!!!!!!!!!!!!

Can someone upload the latest version of mydos to the archive?
is there also a version mydos 4.53/3 ? What improvements are
there over the version on the archive? I assume the /3 or /4
refers to the # of digits in the directory display, right?

if someone wants to email it to me, I can upload it.

3562. XEP-80 & Monitor

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-01 23:54:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9209012354.AA22556@smithkline.com>
Source record: 109609

Jim Johnson's observation of smeared output from an XEP-80 on a color monitor was interesting. I'll have to try it for myself, just to see...

I own several XEP-80's & use them routinely. For text displays you can't beat it.

However, when I FIRST got an XEP-80 I almost gave up on it. The horizontal synch frequency on the XEP-80 isn't quite right. NTSC requires 15.75 KHz on the horizontal synch, but the XEP-80 puts out something like 16.4KHz or so. So, you get tremendous horizontal shear when you hook up an XEP-80 to a monitor that was previously adjusted to work fine with the 40-col output. You have to tweek up the horizontal control on the monitor to get a stable display with the XEP-80. Some monitors might not permit that much range of adjustment. If so, you can't use that monitor with the XEP-80.

Of course, if you tweek up the monitor to work OK in 80-cols, if you switch back to 40-col (using The Alchemist's infamous 80-Column Switcher), then of course your 40-col display is all screwed up & has to be readjusted. If you're using a program like BobTerm that makes use of both outputs, it will drive you outta your friggin' mind to have to re-tweek the display every time you switch.

By rapidly switching back & forth between the 2 displays as you twiddle the horizontal control knob on the monitor, you can find an intermediate setting where the monitor is stable to both displays. That's what I do with mine, & so far it has worked on every mono monitor I've tried (Apple II, Heath/Zenith, converted DEC Rainbow/VT220, & Pi-3 units).

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <kwBgqB2w165w@cyberden.uucp>
Source record: 109613

Boy! For being comp.sys.atari.>8bit< we sure are getting enough Falcon traffic flowing through here! I'll see if I can SOMEHOW post the info. that's available on this system (yes! an IBM board!!) about the Falcon030 onto the 8-bit conference. Even though it's an ST!!...
As the Sysop here (who's a musician, midi-god, etc..hehe) said: "The Falcon is a Midi user's wet dream"... or something very close to that.

Anyways...even if it takes loading BobTerm and jamming the thing onto a disk and ascii uploading it as a post, I'll get this done...

just to stopall the "what is it?"'s!!!

3564. AnsiTerm at Umich

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-02 02:31:22 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1992Sep2.023122.25404@cs.tulane.edu>
Source record: 109610

The latest release of AnsiTerm by Robert Sinclair (c) 1992

AnsiTerm now supports xmodem file transfer, screen captures and keyboard
macros. While still a bit slow, AnsiTerm works Well at 1200bd and does a
fair job of translating ansi graphics for your Atari 8bit platform.

AnsiTerm is a full vt100 Term emulator that requires 48k and an Atari 800
or better to run, as well as one diskdrive and a Hayes compatible modem.

AnsiTerm works with all dos's, MIO and P.R. connection, and already has
80 col output...you won't need any additional hardware.

Works best on mono monitors, but is readable on color sets.

AnsiTerm is now at the archives (ftp atari.archive.umich.edu) in
Atari/8bit/new

3567. Misc. software for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-02 03:50:52 UTC
From: dhong@wam.umd.edu
Message-ID: <1992Sep2.035052.24218@wam.umd.edu>
Source record: 109614

I have about 20-25 disk of software for sale, they are all original,
including some games like Dark Crystal, Arcade Machine, Flight Simulator,
+ some more, I have orignal box and manual for a lot of them, I also have
3-4 word processor, 3-4 graphics package, a spread sheet, dos 2.5 etc, etc.

Don't want to split the whole chunk, what about $30 + shipping for all.

um...simple question...how does one do e71 with the rverter?
none of my vt100 terminals work with it unless its 8bit..
however...bobterm does vt52Odd which does e71 just fine...when
using the rverter? so does bobterm emulate all this and everything
else uses the 850 tables?

Source record: 109621

You CAN hook a XEP80 to a TV set if it has composite video inputs (most VCR's do), HOWEVER I doubt that you would want to. Televisions generally cannot handle more than a 40X25 screen. By pushing an 80X25 screen into a television, the text smears so badly as to be nearly illegible.

Source record: 109617

In a previous article, ichamiel@nyx.cs.du.edu (Itay Chamiel) says:

>re: info-atari-8 readers:
>NO! The Digest has less messages if there is one big one, since
>the digest completes itself after ~600 lines. Which means that a reader
>can just stop reading it, since there is nothing after it. Of course,
>there is an exception if it a shortish file... (~300)

Say the digestifier has collected about 500
lines worth of postings for the next Digest. Now somebody posts a
2000-line .uue file. This produces a 2500-line Digest. And no, that big
file will probably NOT be at the end of the Digest. This is because within
a Digest postings are arranged not in chronological order but in
alphabetical order by subject. That's why Digest readers experience the
strange phenomenon of reading answers to questions before the questions.

While I'm at it: It's FEWER messages. (I'm one of those people that
appreciates grammar.)

Bill Kendrick writes:
> 1) 800XE!?
> ^ I hope that's a typo. If not, give details!!!!

No that ISN'T a typo. The 800XE is quite popular here in Germany.
I didn't know that these computers aren't common in the U.S.A.

I think the 800XE was released around 1989 in Germany.
It looks axactly the same way as a 130XE (you know: that gray
colored case that appeares like a tiny ST).
The 800XE doesn't have a PBI like the 800XE but it has the cartridge
port along with the ECI on the back (same as 130XE).
Unlike the 130XE it has only 64Kb RAM.
I wonder if it isn't just the 800XLF with an XE case?
I don't know for sure, but the 800XE should have the Freddie (sp?)
chip inside.

On the whole the 800XE is a 130XE with 64Kb. Nothing special.

Strange, I don't remember seeing a 65XE around here. I guess
the 800XE IS the 65XE.
Atari seems to give two names for one computer.
65XE in America, 800XE in Europe.

>
> 2) Daemon Attack?
> ^ Is THAT a typo, or just the German spelling of Demon??
> hmmm

You are right here :-)
In this case it is a typo. 'Daemon' is indeed the German spelling
of Demon.

3581. FREE ADS IN ATARI CLASSICS !!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 05:26:48 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9209030526.AA27910@smithkline.com>
Source record: 109627

September 2, 1992
For immediate network release.
Subject: Free Ads in Atari Classics!
From: Ben Poehland, Managing Editor

Greetings to all the Denizens of Telecom Networks!

Atari Classics magazine has made a bold decision to attempt to launch its Premier Issue and main subscription drive at the WAACE Atarifest in Reston, Virginia, USA October 10-11. Our Staff and Publisher are shifting into high gear in an attempt to meet this challenging goal. Frankly, we aren't 100% sure we'll make it, but we're sure gonna give it every ounce of effort! The Premier Issue itself will be used to launch our subscription drive and will be distributed FOR FREE to those sent in their Mail Campaign cards or who have sent a written request to be placed on the free distribution list. If all goes well we hope to have a few spare issues available for distribution at the WAACE fest.

One of the unique features of AC will be its "Swap 'n' Shop" column. This is space reserved in the magazine for free ads from paid subscribers who want to buy, sell, or trade their personal Atari 8-bit items. (We figure it will be a REAL popular part of the magazine!)

Ahhh... but yah see, we got a little problem here. Atari Classics is still in the startup phase. We are presently in production on the Premier Issue and would of course like to include the "Swap 'n' Shop" feature in our very first issue. The problem is, we don't have any paid subscribers yet, so we don't have anyone to send in their free ad!

So what we decided to do is to allow anyone who submits ad copy to us by the following date:

SEPTEMBER 20, 1992

to place an ad in the Premier Issue, absolutely free of charge,

REGARDLESS OF WHETHER THEY SUBSCRIBE OR NOT !!!

We aren't sure at this time just how much page space we'll devote to this column, so it's first come, first serve!

Now, you gotta figure with such a popular feature AC would soon be swamped with ads which would leave us no room for neat articles on programming and hardware hacks and stuff. Plus, we gotta leave space for paid commercial announcements and such. In order to minimize the chaos that could result from this activity we had to place some limits and make a few Rules (uh-oh!). There are 13 of them (yeesh!). OK, yeah, they sound pretty stern and rigid

and all that, but hey- that's why they're Rules, right? Don't feel bad,
The Rules apply equally to everybody (even me!) and will be printed in every
issue of the magazine.

So go ahead and read the Rules, then make up your ad and send it in! You can
mail your ad to AC's postal mailing address given below, or you can e-mail
it to me at:

Internet: poehland%phvax.dnet@smithkline.com
GEnie : B.POEHLAND

PLEASE NOTE: for the Premier Issue ONLY, paid ads in the "Swap 'n' Shop" column
will NOT be accepted, and all personal ads will be truncated to
the 50-word limit. DO NOT SEND MONEY!

A T A R I C L A S S I C S

Swap 'n' Shop
A Flea Market for the Individual Atari 8-Bit User!

-- T H E R U L E S --

1. Ads are FREE to paid subscribers of Atari Classics. Non-subscribers may
place ads at the rate of 2 cents per character (excluding spaces). Payment
should accompany the ad copy. Ad copy from non-subscribers unaccompanied
by payment will be instantly discarded.
2. Free ads are limited to a maximum of 50 words including the advertiser's
contact information. A word is defined as any recognizable combination of
alphanumeric/ASCII characters separated by a space. The language of the ad
must be English.
3. Free ads longer than 50 words will charged 2 cents per character for each
character over the 50-word limit. If payment does not accompany the ad
copy, the Editor will truncate the ad to bring it under the 50-word limit.
4. Atari Classics reserves the right to edit all ads and to reject any ad for
any reason without notification to the advertiser.
5. Ads should be submitted in writing, preferably typed or computer-printed,
to the following address:

Atari Classics
179 Sproul Road/Rt. 352
Frazer, PA 19355 USA
ATTN: Advertising Editor

Illegible ad copy will be discarded by the Editor.
6. All ads MUST contain the advertiser's full name AND postal mailing address
including zipcode for USA addresses. The postal address MUST indicate the
advertiser's country of origin (USA, UK, NZ, France, Germany, etc.). If a
telephone number is included in the ad, please indicate what time of day
you may be reached. It is helpful to include an e-mail address if you have
one. Ads lacking a full name and postal mailing address will be instantly
discarded.
7. This column is for use by private individuals only, who wish to buy, sell,
or trade Atari 8bit items in their personal possession. Users are strongly

advised NOT to advertise non-Atari items or items not related to 8bit computers or game systems (2600/5200/7800/XEGS items are OK). Ads seeking information about Atari 8bit products, or ads offering personal information for the purpose of making social contact with other Atari 8bit users, ARE acceptable.
8. Use of this column for commercial purposes is expressly forbidden. Users found to be violating this policy will have their personal advertising priveledge suspended by the Editors.
9. Advertisers warrant that software offered for sale in this column is on original media accompanied by original documentation. SOFTWARE PIRACY WILL NOT BE TOLERATED. Users found violating this policy will have their personal advertising priveledges premanently revoked, and their subscription to AC will be terminated without refund.
10.For hardware items, it is helpful to indicate the condition of the item. Use the following abbreviations/definitions to describe your hardware item: LN (Like New, the item is pristine, unused, with all manuals and original packaging materials); EC (Excellent Condition, the item has been little used, is in good working order, physically clean, may have a few very minor cosmetic blemishes, with original manuals); GC (Good Condition, the item is in good working order but may be slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, with original manual or copied manuals); FC (Fair Condition, the item is in working order but is missing manuals, heavily worn/soiled or cosmetically damaged); BC (Basket Case, the item does not work, is damaged/butchered, missing manuals etc., but contains salvageable parts).
11.Ads will run only once. If you wish your ad to run again, you must submit fresh ad copy for each issue of the magazine.
12.The Staff and Publisher of Atari Classics will not be responsible for ad copy that gets lost. We will make every effort to handle your ad responsibly, but we are human and muff it every now and then. If for some reason your ad fails to appear, just submit it again.
13.Atari Classics will not be held responsible for any loss incurred for any reason by any person for situations arising from or related to ads appearing in this column. Items offered for sale are assumed represented in good faith. Buyers should contact prospective sellers in advance to insure the availability of the item, arrange for payment terms and shipping, and negotiate the price. All users are expected to be open, fair, flexible, and honest in their dealings with others. Patience, courtesy, and consideration will pay large dividends in securing a successful transaction. Atari Classics does not possess the resources to police the behavior of individual members of the community and will not get involved in disputes between users over deals gone awry. All parties to a transaction are individually responsible for the outcome of the transaction. Buyers and Sellers, be reasonable!

****

3582. ATARI CLASSICS: IT'S ALIVE !!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 05:28:24 UTC

-------============>>>> A T A R I C L A S S I C S <<<<============-------

----------=====>> A New Magazine for the 8-Bit Enthusiast !!! <<==========-----

Greetings Fellow Atari 8-Bit Users!

My name is Ben Poehland, and I'm pleased to announce that I shall be serving as Managing Editor of Atari Classics (AC), a new magazine exclusively devoted to the Atari 8bit user. If you are among the thousands who have bemoaned the recent loss of nationally distributed magazines that once supported your beloved 8-bit, I'm here to add a ray of hope to your 8bit future!

The philosophical orientation of AC- incorporated in its Manifest- is to be a magazine "of, by , and for the Atari 8bit user". Unlike previous 8bit periodicals, the content of AC will directly reflect the expressed desires of the user community, especially as recorded during the Mail-In Campaign conducted January 15- May 2, 1992. The magazine will be staffed by members of the user community, and its content will be drawn entirely from the user community.

Unicorn Publications, already well-known for its outstanding Atari Interface Magazine (which covers both the ST and 8bit markets), has agreed to provide publishing services for AC. AC and AIM will be essentially independent publications, and the addition of AC to Unicorn's stable of products will not affect AIM's present subscribers. One of the many unique arrangements concerning AC is that its actual day-to-day operation will be largely in the hands of the user community rather than the publisher. Whatever "flavor" we decide to give it will be entirely our own.

Atari Classics represents a unique experiment in the history of the Home Computer Revolution that began in the mid '70s. With Atari Corp.'s cessation of support for all 8bit products beginning January 1992, an entire class of machines with a global installed user base numbering in the hundreds of thousands was abandoned along with the community of users who still use them. But for the first time, a rejected user community has marshalled its resources and declared its right to exist independent of Corporate America. We respond to Atari's challenge in a way that would make our forefathers proud: by rolling up our shirtsleeves and doing the job ourselves!

This will be YOUR magazine. AC will succeed- or fail- on the number of subscription orders it receives. Although seed money to print the Premier Issue has been provided, the magazine will need 500 paid subscriptions to succeed. A limited production run of 800 issues is scheduled for October or November 1992. Most of these will be distributed- FREE OF CHARGE- to the roughly 600 people who sent in commitment cards during the Mail Campaign.

That's right: if you sent in your card,

YOU WILL GET TO READ THE FIRST ISSUE FOR FREE BEFORE YOU DECIDE TO BUY.

(When was the last time you saw a deal like THAT???)

Of course, there were some folks who got missed in the Mail Campaign. So we ordered up those few extra copies which will also be distributed for free. First come, first serve, please don't block the stampede! You can write to:
Atari Classics
179 Sproul Rd./Rt. 352
Frazer, PA 19355 USA
ATTN: B. Poehland, Managing Editor

to have your name added to the list for a free copy of the Premier Issue. (No guarantees, and be sure to include your postal mailing address!) If you sent in your Campaign card it will NOT be necessary to request your free trial issue, as your name is ALREADY among the LUCKY 600!

The basic subscription fee is $25/year in the USA, with higher fees for Canadian and other non-US subscriptions. Full details on subscriptions will appear in the Premier Issue and in future announcements. Beginning in 1993 the magazine will be distributed bimonthly (6 issues/year).

A software disk bearing programs published in AC plus selected offerings from the Public Domain, will be available separately for $9/year in the USA. The disk will be distributed independently but will be timed to appear with every other issue of the magazine (3 disks/year). Full details on disk subscriptions will also appear in the Premier Issue and in future announcements.

The content of Atari Classics will initially lean toward user applications, hardware tutorials and modifications, programming, and software reviews. We plan to agressively recruit paid commercial advertising from scarce 8bit vendors, and to publish periodic lists of current 8bit supply sources.

Best of all, PAID subscribers will be able to place FREE ads in AC to buy, sell or trade their personal 8bit treasures! (But of course, yah gotta SUBSCRIBE first!)

And, we'll have a whole bunch of other stuff, contributed by some of the most talented writers and hackers in the Atari 8-bit world, authors whose names you've seen gracing the pages of ANTIC, ANALOG, Current Notes, and Atari Interface Magazine. (You'll notice not very many details there- we wanna pique your imagination!)

As of this announcement (August 5, 1992) only a few of the Staff positions at AC have been filled. We are starting completely from scratch, but anticipate most of the administrative machinery for operating the magazine will be in place by the end of August and production begun on our Premier Issue. (We'll need a month to get used to working with each other in an environment of near-total chaos!)

And when you see that first issue appear in your mailbox this autumn,

IT WILL BE YOUR TURN TO DECIDE THE FUTURE OF YOUR MACHINE !!

Please post/copy/distribute this announcement freely, and stay tuned for future announcements !!!

Just post UUDECODE.BAS and YAU.ARC every once in a while...
I actually might try my hand at a better YAU/YAUEE combo once I
get Quick or Action! working (whichever gets working first!)

3584. The Binary Vote So Far.

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 13:12:39 UTC
From: thester@nyx.cs.du.edu
Message-ID: <1992Sep3.131239.15967@mnemosyne.cs.du.edu>
Source record: 109630

These are the results of the vote to create a
separate binaries newsgroup for the Atari
8-bit so far. Rather disappointing.

YES votes --->34 (35 counting me)
NO votes ---> 2

So it appears we don't have the needed 100.

Due to a mail 'futz' here at Nyx, I lost my
file that kept track of who I had replied to.
Below is a list of all the people that sent
their votes to me by email. (There was one
vote that was posted here.)
If your name (email address) is not below,
and you _did_ send it to me, then something
happened. (Nyx probably happened). If you
are not on the list, send your vote again.
(some sites passed my email address with a
typo for some reason. The correct version
is: thester@nyx.cs.du.edu
If you have not voted on this, please go
ahead and send your vote to me also.
I don't consider this over until at least
next Friday, September 11.

{I have more to say after the list --
don't leave just yet.}

Jody Lenn (lenn@mentor.cc.purdue.edu)
Jeff McWilliams (jjmcwill@mtus5.cts.mtu.edu)

(JCSCHINKER@MIAVX1.ACS.MUOHIO.EDU)
Jim Johnson (Jim_Johnson@abcd.Houghton.MI.US)
neb!jim (uplherc.upl.com!neb!jim)
Joseph Sabatino (ab588@yfn.ysu.edu)
Jeff Stolte (jss@stanley.nde.swri.edu)

Fredrik Lundholm (d1dol@dtek.chalmers.se)
(AKH104@PSUVM.PSU.EDU)
Detlef Johannsen (dinadan@mcshh.hanse.de)
BarryB (n8846069@henson.cc.wwu.edu)
(d87-psk@nada.kth.se)
(chase@physics.rutgers.edu)
Itay Chamie1 (bruck@brachot.jct.ac.il)
Ben Poehland (poehland%phvax.dnet@smithkline.com)
Garold Redenbaugh (garold@cbnewsk.att.com)
Marek Tomczyk (@vm.gmd.de:UJ1G@DKAUNI2.BITNET)
Duane Tribe (tribe@ted.cs.uidaho.edu)
Nick DiMasi (balr!vpnet!nickd@clout.chi.il.us)
Mike Jewison (@aurora.physics.utoronto.ca:jewison@physics.utoronto.ca.)
Michael Current (aa700@slc8.INS.CWRU.Edu)
Null Cypher (swoodwar@nike.calpoly.edu)
Bill Kendrick (cyberden!phbill@moon.nbn.com)
(2PEREIRA_F@spcvxa.spc.edu)
Michael Hill (hill@spot.Colorado.EDU)
Charles Berlinguette (charles.berlinguette@outlan.ersys.edmonton.ab.ca)
End

If you noticed, I didn't include who voted what. (yes or no)
I felt that with only two "NO" votes, I shouldn't put them on
the 'spot'.
I can at least say, this has been interesting. According to
ONLINE ACCESS magazine, there are over 3 million users world-
wide on the InterNet. 37 of us are fans of the Atari 8-bit
computer. (At least one of those 37 doesn't have his Atari
equipment anymore-but remains (from what I have read here)
active and very helpful to the rest of us. That's loyalty of
a very special kind.
I am continually surprised at what both the Atari computer and
the *Atari user* can accomplish. We have kept this little
'magic box' kicking since its inception in 1979. It has a
worldwide group of diehards that won't give in to the notion
of obsolescense. Almost daily (so it seems) you can read here
of new ideas and techniques for stretching the Atari far beyond
the limits of what the original designers thought possible.
So what am I getting at, you ask? Just that even though this
little pocket of 37 (or more) Atari fans may seem miniscule,
we are really limitless if you look at it from the standpoint
of spirit. So what if we don't number one hundred on the net!
We are a unique group of people the way I see it. And the
friendliest, if the comments that came attached to the votes
are any indication.
Before I tread on the edge of nauseating all of you with my
maudlin ramblings, let me quit by saying thanks for
participating in this endeavor to improve our lot by voting
to create a binaries group. It appears that those of you
that, in effect said, "if it ain't broke, don't fix it" were

right. Perhaps those 'lost wares' will still show up if we
allow posting uuencoded files here in comp.sys.atari.8bit.
All we have to do now, is agree upon the etiquette and protocol
needed so that the binary posts can co-exist here with as little
friction possible.
But - I still want to hear from any stray votes out there by
next Friday as I said at the top. I don't think we'll hit
the magic 100, but we can hope can't we?

> else uses the 850 tables?

The R-Verter can do E71 with no problem - the RTerm software which comes
with it can do E71 with a couple of keystrokes. No doubt there's some
XIO command which sets E71 mode - check your R-Verter manual.

3586. Re: The Binary Vote So Far.

I don't understand why you want a binary posting section.
When I first became a member of Free Net I was crest fallen
to learn that I couldn't D/L files directly. Then I found
BART which translated means
Brouge
Archive
Retrival
Thang
According to the explanation, given by Free Net folks, the
UNIX systems or other non ATARI systems
in the net, involved in
the Xfer of files, could corrupt to the ATARI files. This
means that we might have more trouble D/L files than what we
now.

Believe me it took me months to figure out how to get the
files UUDECODED which is an other post in itself. But it was
worth the effort and it was an opportunity for me to
learn more about my machine.

In case any one if confused by this talk of BART; just get
on FREE NET and go to the ATARI SIG, file section and read
all about it.

You didn't mention what equipment you have. For instance, if you just have a direct connect modem for the Atari, like a 1030, you can log onto a local service (like Inter Net) & just mail the files to yourself. Then logon with the IBM & download them. If you have an 850 or PR:Connection for the Atari then you can just buy a "NULL modem connector" for about $10. If you have a modified 1050 disk drive or a double density like Indus, there are a couple of utilities for the IBM that will read them. If all you have is a stock disk drive & the Atari, there's a way to hook them up via the joystick to the IBM serial port, but you need about $3 in parts & a soldering iron.

BART and the archive is fine. I use it quite often.
However, the archive is not the place to put files that are created by applications by any individual user. What I mean is that ASP files (digitized sounds) may be interesting to some users, but shouldn't be archived. Pictures created by (insert favorite art program here) shouldn't be archived either. Music files. Special purpose templates for spreadsheets. And a lot of other things that I can't seem to think of right at the moment. Anything that is trivial (but neat) should be posted. There should be no problem with uuencoding/decoding since that is the way you get things from BART anyway. What is the difference? I get files from BART on my 386, uudecode them and transfer them to my Atari with the "util" program for MYDOS double density format. Works every time.
Where does the corruption come from?

I noticed in Jeff's last post on these newsgroups that he wants Galaga for the 2600. I was unaware that it was ever made! If anyone has a copy and would care to part with it, please e-mail me! I am VERY interested in getting ahold of Galaga (hell, one day I'm going to buy the arcade version!)!! E-mail me and name a price. If your mail bounces or I don't respond within a few days, post on "comp.sys.atari.8bit", Subject: "Bill Kendrick" because out of all these newsfeeds I only read c.s.a.8. Thanx alot!

Hello net_world,

I'm looking for the obscure little item described below, called
a 'frob'. It was a 6502 game development system. If you have one,
whether it be for an Apple, Atari, or whatever, please let me know!
Also looking for the official Atari 2600 game development system and any
other relevant information. Thanks!!

[From an ad in Byte Magazine, August 1983, page 100]:

The Frob 26(tm)

The Serious Game Design Tool

For The Serious Designer

At The Price Of A Toy For The Hobbyist

The Game Cartridge Development System
for the Atari 2600 Video Computer System.

[Picture in ad shows an Apple II-bus board, a 5.25" diskette, a
three-ring bound "The Frob" manual with the cover open, a ribbon cable
with connectors on both ends, and what appears to be two 2600 EPROM/ROM
cartridge boards.]

Features Include:
Real-time development
No hardware modifications required
Apple][48K, one disk drive required

Optional
Atari 5200 Supersystem Adapter Package

[In a box in the center of the ad:] Now Available for the Colecvision

For high profit reward, purchase the tool that can do the job at an unbeatable
price.

frobco

3592. UTIL, ATARIO, SR

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 21:34:27 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GOCRPZ0IVA8Y5HUQ@carleton.edu>
Source record: 109638

For those of us that have been long confused by the various versions of Atari disk readers for PCs, here's what I discovered. It turns out there are several copies of the same thing at the archive.

The various 8-bit Atari disk readers for PCs on the atari.archive:

util.arc
atario.asm
READ.ME
util.c
util.exe
util.txt

pcxfer.arc
atario.asm
pcxfer2.txt
pcxfer.txt
READ.ME
util.c
util.exe

ataridsk.arc
atario.asm
blurb.txt
READ.ME
util.c
util.exe
All of the above are the same UTIL by Charles Marslett.
They are identical copies of util.exe, util.c, atario.asm and READ.ME
Reads/Writes DD Atari disks.

dskutil.arc
ATARIO.ASM
READ.ME
UTIL.C
UTIL.EXE
This appears to be an updated version of UTIL by Charles Marslett.
Util.exe, util.c and atario.asm are larger than before; READ.ME is unchanged.
Reads/Writes DD Atari disks.

atario21.arc
ATARIO.DOC
ATARIO.EXE
ATARIO.PAS
This is ATARIO by Dave Brandman, modified by Kevin White.
Reads DD Atari disks, does not write them.

```
sr.arc
SR.DOC
SR.EXE
This is SpartaRead by Oscar Fowler. Reads DD SpartaDOS disks.

Here are the details:

3593. Bank Switching RAM

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 21:54:18 UTC
From: potter@sunny0.dab.ge.com
Message-ID: <1992Sep3.215418.1568@ge-dab.GE.COM>
Source record: 109639

Well I've upgraded to an 800XL (from a ten-year old 800), and now realize my old copy of "Mapping the Atari" doesn't talk about the bank switching capabilities of the XL/XE series. Can anyone point me to a good reference on the subject (ANALOG, Antic, Compute! articles), especially with examples and what to watch out for? I want to turn off the OS ROM and use the RAM area for extra storage, but of course don't want the program to crash in the meantime (I'll be using assembly language, not BASIC).

Thanks!

3594. Atari 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-03 23:01:05 UTC
From: dam1@Ra.MsState.Edu
Message-ID: <1992Sep3.230105.12932@ra.msstate.edu>
Source record: 109640
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers

I have finally decided to sell my Atari 8-bit system,
it includes the following: (this is an updated list)

Hardware - 800XL with RAMBO XL (256K)
1050 Disk Drive with US Doubler & SpartaDOS 3.2d
1020 color pen plotter/printer
256K Multi I/O Board
ICD hard drive kit -- can include 1 or 2 20 meg hard drives

Accessories - 5 joysticks
1 set of paddles
1 ICD printer cable
1 ICD modem cable

Software on cartridge - BASIC XE

Software on disk - Bank Street Music Writer
The Converter version 1.51
Paper Clip
Print Power
The Print Shop
RAMbrandt version 2.0

Games on cartridge - Asteroids
Star Raiders

Games on disk - Alternate Reality - The City
Alternate Reality - The Dungeon
Artic Antics
ballblazer
Boulderdash Construction Set
Chessmaster 2000
David's Midnight Magic
F-15 Strike Eagle
Hacker
Jawbreaker
Jewels of Darkness
Leaderboard Dual Pack
Master of the Lamps
MRCA Mach 2
Pinball Construction Set
Quest of the Space Beagle (no docs)
Silicon Dreams
Tail of Beta Lyrae
Temple of Apshai Trilogy

Gateway to Apshai
Trail Blazer

Books - Basic Atari BASIC
De Re Atari
Mapping the Atari, revised version (includes XL stuff)

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: May, July, Aug/1985
May*, June, Dec*/1987
Feb, Apr, Nov*, Dec*/1988

* these issues include the disk

Except as noted, all hardware is in great condition and all software
includes documentation.

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

Just FYI, the 7800 version of Galaga is an excellent translation.
Ditto for several other arcade translations of the same era (Robotron,
Xevious, Donkey Kong, etc.) Sorta helps explain the continued
popularity of the 7800.

Thanks for the info, Jon.

A quick question: when you say "free," do you mean that people can
receive Internet mail without paying the $10 monthly charge mentioned in
an earlier post, or merely that GEnie users who have already subscribed
to the Internet mail option (and paid their $10) will not be assessed
the $0.40 per-message fee on incoming messages?

Well, Compute! came out with an XL/XE version of "Mapping the ATARI" after the introduction of the XL/XE machines - I've seen copies, so I know they exist. Try to find one of those.

Just had to add that the TG16 has a version of Galaga called Galaga '91.
(or is that '90?) it is a good "spiffed up" version of the orginal.
They added a few new things, like 2 vertical scrolling areas with "bosses"
(very wimpy) at the end and you are able to go to different levels of
the game. But even with the added stuff it still feels like Galaga of old.
Most levels have the stationary screen and the bugs fly into formation
and has the bonous screens and the music is great!!! (I sometimes play
the game to hear the bonus level music!)

dunham@mpd.tandem.com (Jerry Dunham) writes:

> How do YOU uudecode and xfer to your $ Atari?

>I< just use the "write" command of this BBS which writes a mail message or post as a seperate file in my user directory. (This BBS runs Waffle on an IBM.) Then I use the neat command called "MUFUD," which is a Waffle (plain old "any BBS"?) command that goes through my user directory and uudecodes and files in there it can. The only problem being the way the "Subject:" must be written. Atari Archive sends it as "part aa of aa" or something like that, and MUFUD only understands 1 digit letters or numbers and written a certain way. From there I simply type "edit" and the name I gave the file when I "write"'d it and then list all the lines near 20 (with different headers from different addresses, the "Subject:" isn't always on the same line) and then eventually edit the "Subject:" line to say somethng like: "Subject: filename.uue - Part 1/1". Then I use MUFUD. (BTW: when I type "edit filename" I get into the standard text editor on Waffle and am prompted, so I can chose to clear the file, add to it, insert in it, delete lines, list lines, etc.etc.etc.)

Pretty cool, eh? Probably about the next best thing to simply FTPing! ;)

Beat THAT! (I'm sure SOMEone will)

Huh. I found the 7800 Galaga of poor quality. As a game by itself, it's lots of fun, but compared to the coin-op, it stinks. Very few of the skills usable in the coin-op work on the 7800 version. So I imagine the 2600 version must be weak at best. (Although Galaxian did pretty well.) I also thought Donkey Kong was pretty mediocre. No 4th screen? Thpppthbh! :-P Donkey Kong Junior is quite a bit better.
I'll agree, though, that Xevious and Robotron 2084 are superb.

Oh, 'scuse me, I should've said "a die-hard Atari *8-BIT* fan" -- I've
now observed that the Falcon is relevant to the ST family and therefore
NOT something I would have even CARED about knowing about. Silly me,
though, I thought that since it was mentioned in the *8-BIT* newsgroup,
it MIGHT have something to do WITH the Atari 8-bit, which I AM a fan of.
Go figure...

Source record: 109565

[...]
>What hardware has Atari created in the 8-bit computer line?
>Computers:
[...]
> 1200XL 64K, unique OS

There were at least two different OS versions (A & B) and it's pretty much an XL OS with minor changes. It also had 4 function keys. (F1-F4) (Also programmable LEDs above the keyboard!)

[...]
>Peripherals:
[...]
> 1030 Modem (300 baud, with ???software)

Well, not real software. It "booted" a copy of a dumb ASCII terminal if there was no other SIO boot device. *ICK* It's essentially an 835 with tone dialing and a prettier case.

[...]
>Atari 8-bit vaporware:
> 815 2 x SS/DD 180K with DOS 2.0D

Maybe not-widely-released-ware. A local department store where I used to live had one on display (Hess's in Easton, PA) and I know someone who had (probably still has) one that he claims he bought from Sears. He even gave me a copy of DOS 2.0D way-back-when.

Gosh, makes me want to unpack the old 8-bit and fire it up!

> 1400XL 800XL plus modem, speech synth.
> 1450XLD 1400XL plus 5.25" floppy drive

I might think these would be based more on the 1200XL, since they used the same keyboard/case, but since it was vapor...

Don't forget the 1090 Expansion Chassis for the Parallel Bus Interface!

You might want to contact CSS of Rochester, NY. They put out a kit that makes your XF-551 compatible with your 1050.

Don't forget ANSI Term! (my ANSI program is just for drawing color images. I just realized, though, that even 16 color mode won't hack it. I'll probably have to do APAC to get all the colors (ie, there is black AND white, while in Gr.11 mode there is only black)) ANSI term has Term80 quality, but is VERY slow (Itay, talk to the author..) when it comes to scrolling the screen.

Also, don't forget Itay's Col80 document reader! He devised what seems to be the fastest way of scrolling an 80 col. screen. I still wanna see someone try my two 960-byte GR.0 screen flipping idea. Oh well... (Maybe I'll make it in Action!, now that I have it... but not til I figure it OUT!)

All RIIIGHT! GO ATARI CLASSICS!!!

I'm composing MY ad RIGHT NOW... :-)

You say that if one goes over the 50-word limit one must include payment. We're forever being admonished by the USPS to "not send cash through the mail," so that leaves -- what? Personal checks? Right. So -- TO WHOM should one make out one's check? It irks me that nearly ALL my creditors (gas co., electric co., credit cards, etc.) NEGLECT TO MENTION this vital piece of information (but will surely chew me a new bodily orifice if I GUESS and guess WRONG)...

3616. FREE ADS IN ATARI CLASSICS

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-06 05:37:10 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9209060537.AA18450@smithkline.com>
Source record: 109571

Whoops, Chris, try reading my post again, the answers to your questions are all in there. I suggest you D/L & print it out. Looks to me like you probably read it on-screen & forgot what was said at the beginning by the time you got to the end. Not surprising; it was kinduv a long post.

Anyways, to re-cap: for the Premier Issue only, no paid ads will be accepted in the "SWAP 'n' Shop" column of AC. That means you MUST keep your ad to 50 words or less.

In future issues, longer ads will be accepted, provided that ads longer than 50 words are accompanied by payment (check payable to Atari Classics) mailed to the address for AC given in The Rules & in the various announcements that have been posted.

Hmmm... something I didn't consider... in future issues when we accept longer [paid] ads in "SnS", we'll still accept copy be e-mail. But payemt will have to be by snail-mail, and WE'l need some indication of what the payment is for, ie, a note saying "Enclosed is payment for SnS ad emailed such-&-such a date which was 200 characters in excess of the 50-word free limit" or some such.

BUT... FOR THE PREMIER ISSUE ONLY... we will only accept ads 50 words or less as defined in The Rules, & any longer ads will be truncated to the 50-word limit.

My apologies to those of you who have long lists of items to sell, etc., but we are pushing hard to get the Premier Issue ready in time for WAACE & the prospect of receiving a whole bunch of checks for small amounts of money will gum up the works & slow things down tremendously. In months to come we will be better organized, & thus in a position to offer better service.

Actually, considering as how we've only been in business for one month now, we're not doing too bad & the magazine is definitely moving forwar
d.

3617. alt.ZNET

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-06 07:33:22 UTC
From: znet@status.gen.nz
Message-ID: <gate.BmgoqB1w164w@status.gen.nz>
Source record: 109457
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,alt.znet.fnet

Greetings,

Date : September 06th 1992
Subject : Alt.znet and related groups

For : New Zealand, WORLD

As you may recall we requested a RFD for a news group in the atari
section to carry all the Z*NET FNET feeds. Well I guess it was the
old story of no-one wanting it so it is not going ahead.

What we have done is placed all the news in a ALT group instead.
We have over this weekend placed over 200 messages in the news
group alt.znet.fnet relating from things like Bob Brodie (from
Atari Inc USA) talking about the Falcon to people talking about
the award Z*NET PC won this year.

We have created a series of news groups under the ALT.ZNET banner
being ..

alt.znet.aeo <- this is an ascii magazine called
Atari Explorer On-line (ex ZNET)
and carries not only the magazine
but also the discussion on AEO.
alt.znet.pc <- this is also an ascii magazine
dealing with the PC/UNIX/OS2/
Windows world of computing. This
news group also carries the magazine
and other topics of interest relating
to it.
alt.znet.fnet <- this is the Z*NET FNET gateway. Here
you have a chance to talk back to the
FNET conferences. Currently we are
running at about 100 messages aday
including input from Fido-net as well.

We have not created the alt.znet.zmag at this point as the 8 bitters
have indicated they do not want this magazine in the net at this point
in time. However it is available as well should demand require it.

Well I hope you enjoy all the new news from Atari to OS2 and every machine
on the way. Any comments can be directed to Ron at his CIS address or
via the gateway here to znet@status.gen.nz

Remember to ask your system administrator to carry the alt.znet groups
in your _country_.

Best regards

The Z*NET Global News Gateway Crew.
Z*NET free ascii magazines dealing with most brands of computers.

3618. [col80.arc (1/1)], and binary etiquette

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-06 17:03:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19920906170315.6.JRD@CIROCCO.SCRC.Symbolics.COM>
Source record: 109556

Date: Tue, 1 Sep 1992 11:53 EDT
From: BRACHOT.JCT.AC.IL!bruck@ucbvax.berkeley.edu (Itay Chamie1)

Here is the final version of Col80...

Please don't post binaries here. This point has been beaten to death
many times in the past; if you post binaries, they end up in the digest,
and digest subscribers end up canceling their subscriptions, because
they don't want to wade through it all.
John
Dunning seems to have disappeared...

That's not true. As I've told Itay at least 3 or 4 times in email, I've
been completely snowed under at my "real" job, and haven't had time to
do much other than that lately. I've just now spent a few hours
untangling the stuff that had accumulated in the new/ subdirectory, and
putting it in what I believe are the right places, so you can stop
worrying, everything is now safely in the archives.

As long as we're on the topic, I might as well say a few words about how
to make everybody's life easier when sticking binaries in the archives.
The best possible submission is one that's collected up in an ARC, with
all its sources, docs etc included, and some kind of blurb or something
describing what it is and where it should go in the archives. Why?
Well an ARC is relatively compact, and can be examined and manipulated
on a variety of platforms. That means I can see what's in it, and test
that it's intact, without having to download the thing to my atari. The
blurb/doc helps a lot, because it gives me a hint about where to put it
in the archives, as well as something to put in the catalog listing.

If you've got a new version, or a bugfix, or something like that, please
say so, so I'll know to update/replace the old version. If you've got
an intermediate version, say so, so that I can tell it's experimental,
and not delete the good copy.

Obviously those rules don't apply in every single instance; you might
have something that needs to be a disk image, and thus needs to be
packaged as a DCM file or something. Or it might be too big, so you
have to split it up. But give it a try.

What, you say, that Dunning character is being a junior fascist again,
and dictating to us what hoops we have to jump through before he'll
deign to put things in the archive for us? Well, if you choose to look
at it that way, it's up to you. I submit, though, that there's another
way to look at it. I've got limited time to devote to this effort, and
the harder you make it for me to figure out what's what, the less

inclined I am to try. The more you help me out, the better shape the archive will be in. Please folks, we're all supposed to be on the same side here.

3620. Help! Uudecode/Yau.com

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-06 17:22:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19920906172259.7.JRD@CIROCCO.SCRC.Symbolics.COM>
Source record: 109562

Date: Mon, 31 Aug 1992 13:32 EDT
From: news.mentorg.com!caeco!neb!bbs@uunet.uu.net (BBS System 801-967-8072)

I've just requested two files (and received them) from the Atari archives at umich.edu. Problem is this: One file (raindemo.arc) came to me in several parts (about 4, I believe). I had the system send them to me, received them to hard drive on my Atari 800xl. Now, how do I turn those 4 parts into one functional .arc file? Running Yau.com, it tells me, cant read header (or something of that nature). Do I need to /a append the 4 files to one another in sequence - thereby creating ONE file (out of 4), then run Yau.com on them?

Essentially, yes. The uuencoder in use at the archive splits the file up, to avoid croaking mailers along the way.

However, you need not go through lots of pain hacking text files if you don't want to. The uuencoder and companion decoder that treat files that way are written in C, and run on all kinds of things. I compiled them up with CC65 a while ago, mostly as an example of how to port programs to CC65. Look in the cc65/ subdirectory of the archives, for a file called dumasuu.arc. Save the various pieces of uue file as foo.uaa, foo.uab etc, then run the Dumas uudecoder on the first one. It should pick up the rest.

This decoder and encoder aren't as fast as YAU and YAUE, but they are more general.

3621. 130 XE... now what?

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-06 23:47:17 UTC

i recently was given an Atari 130XE with 1050 drive. i would like to make
use of all the wonderful software for it on atari.archive.umich.edu, but
realize some hardware upgrades are in order:

where might i find the following:
1- 80 column video board (and whatever monitor it eats...)
2- 360k floppy drive
3- RS232 and centronics interface box

also, can it handle hard drives?

thanks in advance

.
I have the following atari 8 bit items for sale or trade:
.
Atari 1050 'Happy' - runs at WARP speed - awesomely fast!
Atari 850 modem/printer interface
Trak double density drive w/double density slave drive & printer
interface & cable!
Sx-212 1200bps direct connect or rs232 connect modem
Rana Systems 1000 Double density disk drive
Indus GT double density disk drive
ADC 1200 bps rs232 modem
2 x Atari 800xl w/64k
1 x Atari 1200xl
.
All items function perfectly and have been restored to 'NEAR MINT'
condition. Best reasonable offers considered on any items.

Atari 8-Bit Stuff for sale:

1) Okimate 10 color/B&W printer with

"plug-n-play" interface for 8-bit

Atari, color and B&W ribbons,

screen dump software, $75.

2) Atari 1020 Printer/Plotter w/

pens and paper. $10. + shipping.

3)Pilot Programming Language

w/"Turtle" graphics, (Educators'

package), $15.

4)Conversational Italian (learn

Italian with your computer! - $10.

5) The Newsroom (desktop publishing

with your 8-bit Atari!), $10.

6) Timewise (Time management), $10.

7) Atari Invitation to Programming,

2 and 3, $5. each.

8) Atari Speed Reading, $10. plus shipping.

9) Atari 310 (300 Baud) Modem, $15.

10) "Kingdom" (Instructions and

game, cassette), $3.

11) "Biorhythms", (Instructions and

game, cassette), $3.

12) SOLD!

13) "Super-Text" word processor

(disk), $5.

14) SOLD!

15) "ETMODEM" Communications

program, $5.

If interested, please send list of

items wanted and payment to:

Melvin Zwillenberg

475 Richmond Avenue

Maplewood, NJ 07040

(I will promptly refund any excess

for items which have already been

sold.

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY

SHIPPING ON ALL ORDERS OVER $35.

All these prices are negotiable. I am especially receptive to package

offeres that move a lot of items!

Third party huh? Well I figured I'd start a discussion on the
possiblity of getting an 8bit emulator in there... Something to discuss,
huh? All we would really have to get would be the rights/permission of the
Atari to use their OS... Not a small task I'm sure... This would defiantly
be a start on the "Super 8bit"...

>
>and lastly.. there are compability modes for ST Low, ST Medium, and ST
>High on both VGA monitors and SC1224 monitors. (On a color monitor, ST
>High is achieved by using the interlace mode).
>
>Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as
>well. However, it only supports one resolution: ST High Resolution.
>
>All modes on a TV can be overscanned. This means multiplying the X and Y
>resolution by 1.2. For example, modes with 320 pixels of horizontal
>resolution (X res) will become 384 pixels across, and modes with 640
>pixels will become 768 across. Overscanning is done in the X and Y
>resolution. You can't do them independently. Special Note: On a VGA
>monitor, overscan is "faked".. since the video hardware doesn't have the
>capability to do overscan on a VGA monitor, we made it so that if a
>overscan mode is set on a VGA monitor, you still see the normal size
>screen, but the screen is a window onto the bigger overscanned image.
>Make sense? We did this for compatibility. This way if a game that has an
>overscanned starup picture can use the same pic on both the VGA monitor
>and the TV monitor. Pretty cool, eh? <grin>

>
>BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will
>work just fine with it, but because you can't see the parts of the
>screen, we thought that that option shouldn't be available from the
>desktop. We don't want to confuse people. However, Overscan can be set
>using a new XBIOS call (Vsetmode()).. so it is still available.
>
>I hope I haven't made any mistakes. I triple-checked this document in
>search of errors and I couldn't find any. If you do find some, send me
>Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.
>
>-- John Townsend, Atari Corp.
>
>P.S. Anyone who would like to reprint this message, please do so!
> The smaller the number of times I have to type that message, the
> more my fingers with thank you! ;-)
>

********** A T A R I C L A S S I C S **********

LETIN...BULLETIN...BULLETIN...BULLETIN...BULLETIN...BULLETIN...BULLETIN...BULLE

---------- ATARI CLASSICS SUBSCRIPTION DRIVE ----------

In response to inquiries about subscriptions to Atari Classics, we apologize for any confusion and beg your patience and understanding as we struggle through our startup phase. AC is still in process of being formed, and our main priority is to have the Premier Issue ready in time for WAACE.

AC is NOT officially accepting paid subscriptions at this particular time. We will begin accepting paid subscriptions by mail as of October 12, 1992. Look for an announcement on all networks around the 2nd week of October, giving details on subscription plans and fees.

We plan to start our official subscription drive at the WAACE Fest in Reston, Virginia October 10-11. If all goes according to plan, we will have advance copies of the Premier Issue of Atari Classics- and subscription forms- available at the Unicorn Publications booth. I plan to be there in person, along with Bill and Pattie Rayl, to hawk our wares and collect subscriptions.

People should understand there is a slight element of risk involved. AC will require a subscriber base of 500 to maintain its proposed bimonthly publication schedule. If fewer than 500 people subscribe, we can't guarantee you'll get 6 issues for your money. If only a very few subscriptions are received, the magazine may sputter on for several more issues then die out completely. If we die, there will be no refunds. Officially, we are really only in business for one issue. We are gambling that the interest expressed by the 8bit community in the Atari Classics concept will be followed through with enough subscriptions to make AC a viable enterprise in 1993.

The Premier Issue will be distributed for free to all individuals who sent in their Mail Campaign pledge cards over the past winter/spring. It will also be sent to those who have mailed in their postal address in response to the announcements posted since AC became official on August 5, 1992. Although we are making every effort to insure these people will get their free issue, demand has been unexpectedly heavy, and we are considering possibilities for increasing our initial print run from 800 to perhaps 1000 or more. We want to assure the 600 people who sent in pledge cards that they are our FIRST priority and will absolutely receive the free Premier Issue (and, along with it, the opportunity to become a paid subscriber). Without the Faithful 600, AC would never have come into being, and we have not forgotten that!

We are delighted with the enthusiastic response we have thus far received, and would prefer all interested parties to just send us their name and postal mailing address at this time instead of trying to subscribe. Send your address

to:
Atari Classics
179 Sproul Road/Rt. 352
Frazer, PA 19355
ATTN: B. Poehland, Mging. Ed.

You can also send your mailing address via email to me on GEnie or Internet:

GEnie : B.POEHLAND
Internet: poehland%phvax.dnet@smithkline.com

Compuserve or Delphi users who don't have Internet access can send their postal mailing address to our Telecommunications Editor, Lawrence Estep:

Delphi: LESTEP
CIS : 71450,1050

who will forward them to the magazine. Several folks have sent us their email address; that doesn't help us much since it's kinda hard to send a hardcopy magazine to an email address. Postal addresses only, everyone!

The Premier Issue will contain a Subscription Form. We want you to see and feel our product before you plunk down your cash. To some extent your subscription will be an act of faith. But the Premier Issue itself will be an act of faith, extended to those members of the 8bit community who have already expressed their faith in us and their willingness to take a chance on their- our- own future.

AC asks all potential subscribers to be patient, wait for things to develop at a pace we can handle. We on the Staff of AC are part-timers and amateurs; after only a few weeks in operation we are at best a disorganized rabble. We need time to shake down as a team and set schedules we can keep. Please give us that time, and hold aside your subscription money until October 12. But if you really just can't wait, then present yourself at the Unicorn booth at WAACE on October 10 where I'll be glad to assist you in making a withdrawal from your wallet in support of Atari Classics <grin!>.

A final note: The mass mailing of the Premier Issue is tentatively scheduled for the last week of October, and it will contain a Subscription Form.

3630. FREE ADS In ATARI CLASSICS

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-07 19:11:21 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9209071911.AA29771@smithkline.com>
Source record: 109576

September 2, 1992
For immediate network release.
Subject: Free Ads in Atari Classics!
From: Ben Poehland, Managing Editor

Greetings to all the Denizens of Telecom Networks!

Atari Classics magazine has made a bold decision to attempt to launch its Premier Issue and main subscription drive at the WAACE Atarifest in Reston, Virginia, USA October 10-11. Our Staff and Publisher are shifting into high gear in an attempt to meet this challenging goal. Frankly, we aren't 100% sure we'll make it, but we're sure gonna give it every ounce of effort! The Premier Issue itself will be used to launch our subscription drive and will be distributed FOR FREE to those sent in their Mail Campaign cards or who have sent a written request to be placed on the free distribution list. If all goes well we hope to have a few spare issues available for distribution at the WAACE fest.

One of the unique features of AC will be its "Swap 'n' Shop" column. This is space reserved in the magazine for free ads from paid subscribers who want to buy, sell, or trade their personal Atari 8-bit items. (We figure it will be a REAL popular part of the magazine!)

Ahhh... but yah see, we got a little problem here. Atari Classics is still in the startup phase. We are presently in production on the Premier Issue and would of course like to include the "Swap 'n' Shop" feature in our very first issue. The problem is, we don't have any paid subscribers yet, so we don't have anyone to send in their free ad!

So what we decided to do is to allow anyone who submits ad copy to us by the following date:

SEPTEMBER 20, 1992

to place an ad in the Premier Issue, absolutely free of charge,

REGARDLESS OF WHETHER THEY SUBSCRIBE OR NOT !!!

We aren't sure at this time just how much page space we'll devote to this column, so it's first come, first serve!

Now, you gotta figure with such a popular feature AC would soon be swamped with ads which would leave us no room for neat articles on programming and hardware hacks and stuff. Plus, we gotta leave space for paid commercial announcements and such. In order to minimize the chaos that could result from this activity we had to place some limits and make a few Rules (uh-oh!). There are 13 of them (yeesh!). OK, yeah, they sound pretty stern and rigid

and all that, but hey- that's why they're Rules, right? Don't feel bad,
The Rules apply equally to everybody (even me!) and will be printed in every
issue of the magazine.

So go ahead and read the Rules, then make up your ad and send it in! You can
mail your ad to AC's postal mailing address given below, or you can e-mail
it to me at:

Internet: poehland%phvax.dnet@smithkline.com
GEnie : B.POEHLAND

PLEASE NOTE: for the Premier Issue ONLY, paid ads in the "Swap 'n' Shop" column
will NOT be accepted, and all personal ads will be truncated to
the 50-word limit. DO NOT SEND MONEY!

A T A R I C L A S S I C S

Swap 'n' Shop
A Flea Market for the Individual Atari 8-Bit User!

-- T H E R U L E S --

1. Ads are FREE to paid subscribers of Atari Classics. Non-subscribers may
place ads at the rate of 2 cents per character (excluding spaces). Payment
should accompany the ad copy. Ad copy from non-subscribers unaccompanied
by payment will be instantly discarded.
2. Free ads are limited to a maximum of 50 words including the advertiser's
contact information. A word is defined as any recognizable combination of
alphanumeric/ASCII characters separated by a space. The language of the ad
must be English.
3. Free ads longer than 50 words will charged 2 cents per character for each
character over the 50-word limit. If payment does not accompany the ad
copy, the Editor will truncate the ad to bring it under the 50-word limit.
4. Atari Classics reserves the right to edit all ads and to reject any ad for
any reason without notification to the advertiser.
5. Ads should be submitted in writing, preferably typed or computer-printed,
to the following address:

Atari Classics
179 Sproul Road/Rt. 352
Frazer, PA 19355 USA
ATTN: Advertising Editor

Illegible ad copy will be discarded by the Editor.
6. All ads MUST contain the advertiser's full name AND postal mailing address
including zipcode for USA addresses. The postal address MUST indicate the
advertiser's country of origin (USA, UK, NZ, France, Germany, etc.). If a
telephone number is included in the ad, please indicate what time of day
you may be reached. It is helpful to include an e-mail address if you have
one. Ads lacking a full name and postal mailing address will be instantly
discarded.
7. This column is for use by private individuals only, who wish to buy, sell,
or trade Atari 8bit items in their personal possession. Users are strongly

advised NOT to advertise non-Atari items or items not related to 8bit computers or game systems (2600/5200/7800/XEGS items are OK). Ads seeking information about Atari 8bit products, or ads offering personal information for the purpose of making social contact with other Atari 8bit users, ARE acceptable.
8. Use of this column for commercial purposes is expressly forbidden. Users found to be violating this policy will have their personal advertising priveledge suspended by the Editors.
9. Advertisers warrant that software offered for sale in this column is on original media accompanied by original documentation. SOFTWARE PIRACY WILL NOT BE TOLERATED. Users found violating this policy will have their personal advertising priveledges premanently revoked, and their subscription to AC will be terminated without refund.
10.For hardware items, it is helpful to indicate the condition of the item. Use the following abbreviations/definitions to describe your hardware item: LN (Like New, the item is pristine, unused, with all manuals and original packaging materials); EC (Excellent Condition, the item has been little used, is in good working order, physically clean, may have a few very minor cosmetic blemishes, with original manuals); GC (Good Condition, the item is in good working order but may be slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, with original manual or copied manuals); FC (Fair Condition, the item is in working order but is missing manuals, heavily worn/soiled or cosmetically damaged); BC (Basket Case, the item does not work, is damaged/butchered, missing manuals etc., but contains salvageable parts).
11.Ads will run only once. If you wish your ad to run again, you must submit fresh ad copy for each issue of the magazine.
12.The Staff and Publisher of Atari Classics will not be responsible for ad copy that gets lost. We will make every effort to handle your ad responsibly, but we are human and muff it every now and then. If for some reason your ad fails to appear, just submit it again.
13.Atari Classics will not be held responsible for any loss incurred for any reason by any person for situations arising from or related to ads appearing in this column. Items offered for sale are assumed represented in good faith. Buyers should contact prospective sellers in advance to insure the availability of the item, arrange for payment terms and shipping, and negotiate the price. All users are expected to be open, fair, flexible, and honest in their dealings with others. Patience, courtesy, and consideration will pay large dividends in securing a successful transaction. Atari Classics does not possess the resources to police the behavior of individual members of the community and will not get involved in disputes between users over deals gone awry. All parties to a transaction are individually responsible for the outcome of the transaction. Buyers and Sellers, be reasonable!

****

3631. Action! problem.

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-07 19:43:40 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <HZXqqB4w165w@cyberden.uucp>
Source record: 109580

Remember APACSET2, that little LIST I made (I didnt upload it to the archives yet, did I?!?!?). Anyways, I loaded it into Action! and edited it as best as I know how, but it just won't work! (it crashes, luckily [RESET] saves it (usually)). I believe my problem may be in my "PROC CALL=$0600()" or my attempt to fill up page 6 with data...

Here's what I've got:

```
; apacset v3.0 bill kendrick 9-7-92

Module
Card DL ; DL is global

Proc Call=$0600() ; aka U=USR(1536)

Proc APAC()
Byte Pos
Card SC,TempCard,Counter
Byte Array MLRtn="<ML routine to turn on APAC mode..it's 79 bytes long>"
Graphics(11)
DL=(Peek(106)-40)*256 ; find room for DL
TempCard=PeekC(560) ; copy some of old DL
MoveBlock(DL,TempCard,3) ; into new DL
TempCard==+198
MoveBlock(DL+572,TempCard,10)
SC=PeekC(88)
For Counter=3 TO 570 Step 6
Do
Poke(DL+Counter,207) ; write new DL data
PokeC(DL+Counter+1,SC+Pos)
Poke(DL+Counter+3,79)
PokeC(DL+Counter+4,SC+Pos+3840)
Pos==+40
OD
PokeC(560,DL) ; set display list pointer to DL
MoveBlock(1536,MLRtn,79) ; copies ML routine into Page 6
Poke(204,0)
Call() ; call APAC routine at page 6
Return

Proc ScreenOn(Byte Dither,Lum)
Graphics(43)
PokeC(560,DL) ; point display list to APAC2 DL
Poke(54286,192) ; turn on DLI
Poke(204,Dither)
Poke(712,Lum)
Return
```

```
Proc Off()
Graphics(41)
Return

Proc Demo()
Byte Col,Lum,X,Y,XDir,YDir
APAC()
ScreenOn(1,4)
Do
Lum=Lum+1
If Lum=16 Then
Lum=0
Col=Col+1
If Col=16 Then
Col=0
Fi
Fi
Color=Col ; color
Plot(X,Y)
Color=Lum ; luminence
Plot(X,Y+96)
X=X+XDir
If X=79 Then
XDir=-1
Fi
If X=0 Then
XDir=1
Fi
X=Y+YDir
If Y=95 Then
YDir=-1
Fi
If Y=0 Then
YDir=1
Fi
Od
Return
```

Here's a quick rundown. CALL is just the equivalent to "USR", but in Action! you've got to make it a PROCedure and tell it where to point to. PROCedure APAC is the routine that stores the APAC mode ML routine into page 6 memory (or at least TRIES to) and sets up the APAC2 display list. SCREENON simply turns on the graphics mode, points to the new display list (for APAC2) and sets the DLI, dither mode and screen luminence. OFF just turns off dither and sets the screen to normal (not APAC2). Finally, DEMO calls APAC and SCREENON to set it up, then just bounces a dot around on the screen (leaving a trail of 256 different colors). If you were to add a GRAPHICS(11) or (9) command right after the SCREENON(), it will at least get to the drawing routine, but I think there might be some sort of problem drawing onto the APACscreen. Duh, I guess I could attempt loading a screen into memory, then setting up the APAC mode... Anyways, that's not JUST what I want it to do, so I still need this

little ditty fixed!! Any help would be MUCH appreciated. I haven't read through the ENTIRE Action! manual, but I read (over and over!) bits about arrays and routine calls and stuff.

Again, my best guesses is either 1) didnt do the page 6 setup right
2) didnt copy data from MLRtn to page 6
properly.
3) don't have the memory set up right
for the graphics mode or DL free RAM
(I'm assuming Graphics() calls alloc-
ate free RAM, but maybe pointing DL
to RAMtop-40 was a stupid idea by me)
anyways.... thanx in advance.....(grumble grumble.. I need to read that book AGAIN!)

I'm afraid you do need to subscribe to Internet, but there is no per-message
charge for incoming messages. You can subscribe to mailing lists, so you
can get the Info-Atari8 Digest for free, instead of downloading it at $6 per
hour.

Go for it! It would be great to have one that handles multi-part files,
either the way BART sends them (part aa of zz), or the way everyone else does
(Filename.ext 1/100). I've seen C source code for some multi-part decoders,
but they're written for Unix, and the actual decoding is done by a pipe to
uudecode (ie: the source code doesn't contain the actual decoding algorithm.)

That kit, called the XF551 Enhancer, only makes it possible for the XF551
to format the back side of a flippy disk. CSS also makes other kits that
let you use a 3.5-inch drive with the XF551.

Source record: 109581

In article <1992Sep7.114700.429@altair.selu.edu>, pcs$1393@altair.selu.edu says:
>
>How much will a subscription to A.C. cost. Jeff was nice enough to answer my
>query concerning how to apply, but how much do I send? Thank you Jeff M.
>
No No NO. Please don't send any money to subscribe to the publication
right now. It will only gum up the works.

Right now the priority for the Atari Classics staff is the premiere
issue. This goes out free of charge to all who send their names
into Ben Poehland, or who responded to the campaign earlier this year.

Atari Classics is not currently accepting paid subscriptions, and will
not do so until October 12, 1992.

Please keep in mind there is a bit of risk involved. The premiere
issue is being sent to people for FREE. A subscription form will
be included with the magazine. If you like what you see then you fill
out the subscription form, and include the indicated amount for
the price of the subscription, and optionally, a disk.
Atari Classics is COUNTING on receiving 500 subscriptions from those
who have received the magazine. The cost of the magazine, frequency,
and format of the magazine is based on 500 subscriptions being received
for the publication. If fewer than 500 subscriptions are received,
then there is no guarantee the subscribers will receive 6 issues
per year as indicated in all previous press releases. If only a very
few subscriptions are received, the publication may sputter along
for several months and then die. If Atari Classics dies, there will
be no refunds. There were 615 positive replies to the campaign
and additional positive response from those who weren't able to
participate in the campaign. Based on this, I am confident that you 8
bitters will like what you see, and stand behind your statement on
your cards stating that you will subscribe. I have no doubt that
Atari Classics will receive more than 500 subscriptions, and
that it will become the leading magazine for the Atari 8 bit community.

Please be patient, and let things develop at a pace that the Atari
Classics staff can handle. We're all part-timers and amateurs
and after only only a few weeks in operation, the publication
machinery is only beginning to take on a rough form.
As time progresses, the Atari Classics staff will begin to operate
more like a fine tuned engine, and be able to set and meet the required
deadlines. So keep those subscription checks in hand until October 12,
and give Atari Classics a little more time to assemble itself.

For those of you who are thinking of attending the WAACE Fest on October 10 and 11. Ben Poehland, managing editor of Atari Classics, has made plans to attend and be present in the Unicorn Publications booth. We hope to have copies of Atari Classies at the show to distribute, and Ben will be taking subscriptions at that time. The mailing of the premiere issue is tentatively scheduled to take place the last week of October, and it will include the subscription form as mentioned above.

So hang in there, be patient, and keep your fingers crossed. If you get a chance, stop by the Unicorn Booth at the WAACE show and say "HI" to Ben and take a gander at a magazine that could really breath new life into the 8-bit scene.

Now I have to go and finish up my first installment of "Moonlight Workshop"... see you in Atari Classics!

3636. Connecting an RS232 modem to an Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-07 23:10:30 UTC
From: norlin@midway.ecn.uoknor.edu
Message-ID: <1992Sep7.231030.7510@constellation.ecn.uoknor.edu>
Source record: 109582

After scrounging around for the past few months, I've finally assembled a reasonable Atari 8-bit system (800 + 810). The only thing it lacks is a modem. I have an external RS232 300bps modem, but have no 850 interface (nor similar device). Is there a simple circuit that I can build myself that will allow me to use my modem with my Atari?

Thanks in advance.

Norman Lin

question about the disk subscription: will it be made
available on internet, on the atari archive? or is a disk
subscription the only way to get it? I'd like to see it
be available, if possible.

3639. More Atari things for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-08 02:22:59 UTC
From: csmith@nmt.edu
Message-ID: <1992Sep8.022259.19807@nmt.edu>
Source record: 109455

Okay, I see lots of atari hardware for sale on atari.8bit, but I have no idea how much of it actually is sold. At any rate, I will try my luck. Yes, I have decided (at long last) that it is time for a more powerful system, so to help the cost I will part with my 8-bit.

FOR SALE:

Atari 800XL computer w/64K - Good condition. Has run perfectly for many years.

Atari 1050 disk drive - Supports enhanced density, no fancy upgrades on it.

Atari 1025 dot matrix printer - Good condition.

All cables, cords, and power supplies included. All components in good working order and have worked for me for years.

You make the offer & pay shipping costs, and it can be yours!
I would prefer to sell the system as a whole, but it is not necessary. If you do not need the whole thing, I can understand that, and I will consider selling components individually. I also have amassed a whole bunch of software, too. I would probably throw that in with a sale also, seeing that I wouldn't really need it any more.

I need the money to put towards my next system!
I will consider all offers! Just name it.

Clay Smith
csmith@titan.nmt.edu

Michael Current's FAQ contains:

> 65XEM 65XE plus AMIE sound chip

Hm, never heared of an AMIE sound chip. What is it exactly?
Is it as good as the SID(?) inside the c=64?
Is it possible to get the sound chip from somewhere and add it to
my 130XE? How much does the AMIE costs?

Jeff, since I just can'T seem to send you any type of netmail, in response to the messages you sent to me in netmail, if at all possible call my bbs so I can get you the information you need on repairs, SpartaDOS or whatever else you need.

Warp 10 BBS 612-774-0077.

To the Moderator: This is NOT an ad to obtain users. This is the ONLY way that I can communicate with Jeff because my netmail always gets bounced. More than likely it's something I'm typing wrong, but in consistantly trying for the past few months to send Jeff netmail, all attempts have failed.

To Jeff: After logon, access is instant. Send feedback letting me know what handle you decide to use and I'll get the information to you right away so it doesn't cost so much in l/d. If you think you'll be calling, let me know appx. when, and I'll be looking out for your call.

I've got an ARC file with all the instructions, but I've been to lazy to UL it to the archive. It couldn't be much simplier. If you're using Express MPP you just buy a 25 pin connector & (I think?? been a while) tie the 2nd joystick trigger line to ground & use stick forward for data, etc. most of the stuff written for the MMP will work with it & I wrote a number of things for transfering files over joystick 1, but they're all in 8-bit format. Let me see if I can E-mail you some stuff.

3643. Re: Connecting an RS232 modem to an Atari?

Newsgroup: comp.sys.atari.8bit

Source record: 109587

I'm digging out some old stuff I did. 'IF' you only need 300 baud, then you can use a converted joystick with the MPP R: handlers. I've used it with an Avatex & Supra modems. Your really need access to terminal software to get the the handlers/Express to begin with though.
If I screw up the Message Base here, please excuse me. It's easier then the undecode etc even if it doesn't work.

3644. Re: Action! problem.

```
BTW: I replied to this on BAAUG, but I just noticed one other thing. If you
store ML in an Action! string/byte array, the first character in the array
will be the length of the string. Since the basic pushes stuff on the stack
you'll probably have to (Sheesh! on line so mistakes are possible!)

MoveBlock($600, APACtn+1, 79)

then call it by making the procedure point to $601 to pass the 1st PLA.
```

Rick Cortese 2/13/91
20802 Laurel Road
Los Gatos, CA 95030

How to attach RS-232 devices to a joystick port.

1st I'd like to apologize for the verbose instructions
<grin>.

For those people that are worried about whether or not I have real serial ports, the answer is yes: Both an 850 & PR:Connection. The reason I looked into this is I felt we were loosing people from the Atari community when we recommended the standard methods of transferring data, that is: Buy a disk drive for $200, a $16 cable, an $80 interface, and a $10 null modem. Although it was never said, I know most people probably balked at spending $300+ on a computer with a street value of $50. I imagine most of them just bought a clone for a couple of extra bucks. With that in mind I paid little attention to doing this right and a lot of attention to doing it cheap.

The 1st thing you'll need is a joystick cable. Just about any cable that works with the Atari or 2600 VCS is suitable. B&C Computer Visions sells cables for $1.50 & I know San Jose Computer used to sell joystick extension cables for a buck or two. I'd recommend salvaging one from a busted joystick if possible. The other parts are readily available from Radio Shack or JDR Micro Devices in San Jose (My personal favorite). JDR's toll free number is 800-538-5000. JDR's minimum charge is $10 + $2.50 P&H so you may want to pick up some other goodies at the same time, like a V20 for your IBM or maybe some SIMs for your ST.

I also wrote a two short BASIC/ML routines for transferring test files between the 8-bit Atari to my ST and clone. I've included the source code for anyone who'd like to see how it's done. If you have an assembler you may want to see how fast you can get the transfers to go. The one from the receiving data isn't as short as it could be, but it was short enough that I didn't bother optimizing it. You're limited to transferring files that are less then 30,000 bytes long, but this should be enough to transfer a MPP type telecommunication program, MPP was the Co. that developed a modem that plugged into joystick port(2), type. I didn't bother figuring out how to transfer binary files to the 8-bit from an ST because I hate ST basic that much. I could've done it in 'C, but

I think most people that have an ST also have enough software for the 8-bit to get the set-up to work. There are many BBS's that have EXPRESS.MPP or the MPP drivers, people like B&C Computer Visions in Santa Clara CA that sell public domain software for $3 or $4, and user groups where you can get a copy. If it's a problem, let me know & I'll do it. I'd like to recommend that you make the RS-232 type cable then buy a "NULL MODEM FEMALE-FEMALE" type connector. It'll be an extra $10, but you'll end up with a more versatile set-up. You could really make both types of cables cheaper then you could buy a NULL connector, but it's up to you. I've tested the RS-232 cable with a Supra 2400, Avatex 1200, ST, and clone, they all work. The joystick NULL cable works with the clone & ST. For some files it well be necessary to print them to disk on the 8-bit before the ST or IBM can capture them properly. This is due to different values for carriage return and line feeds use by the different computers. For using telecommunication software with NULL connectors make sure you are not using software that thinks it's hooked to a Hayes modem unless you have a way to force it into terminal mode.

3646. Re: Connecting an RS232 modem to an Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-08 18:13:02 UTC

Message-ID: <65462@cup.portal.com>
Source record: 109591

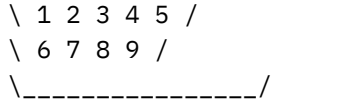
All the programs in the ARC file except this and "RECIEVE.PRN" are in 8-bit format so you may have to transfer them to your 8-bit before you can read them properly.

How it works: For the most part, the joystick cable can not supply enough horsepower to drive a standard RS-232 device. What I did was use the hand shaking lines of the device we connect to for shaking their own hands/suppling their own drive current. All the MPP drivers/telecommunication programs use joystick(2) trigger for determining if there's a carrier signal present. We just tie this line to ground so it thinks it's connected to another device. To use EXPRESS.MPP you just press 'G for answer phone or use 'E and just dial a '1 to get to the terminal mode. Once in the terminal mode you have to use the Hayes command set to your modem to dial (i.e. ATDT 555-1212). For connecting to an ST or clone, you may have to use 1/2 duplex on both ends & make sure you set the BAUD to 300!

EXAMPLE #1

NULL MODEM FOR USE WITH EXPRESS.MPP OR HANDLERS JOYSTICK(2)

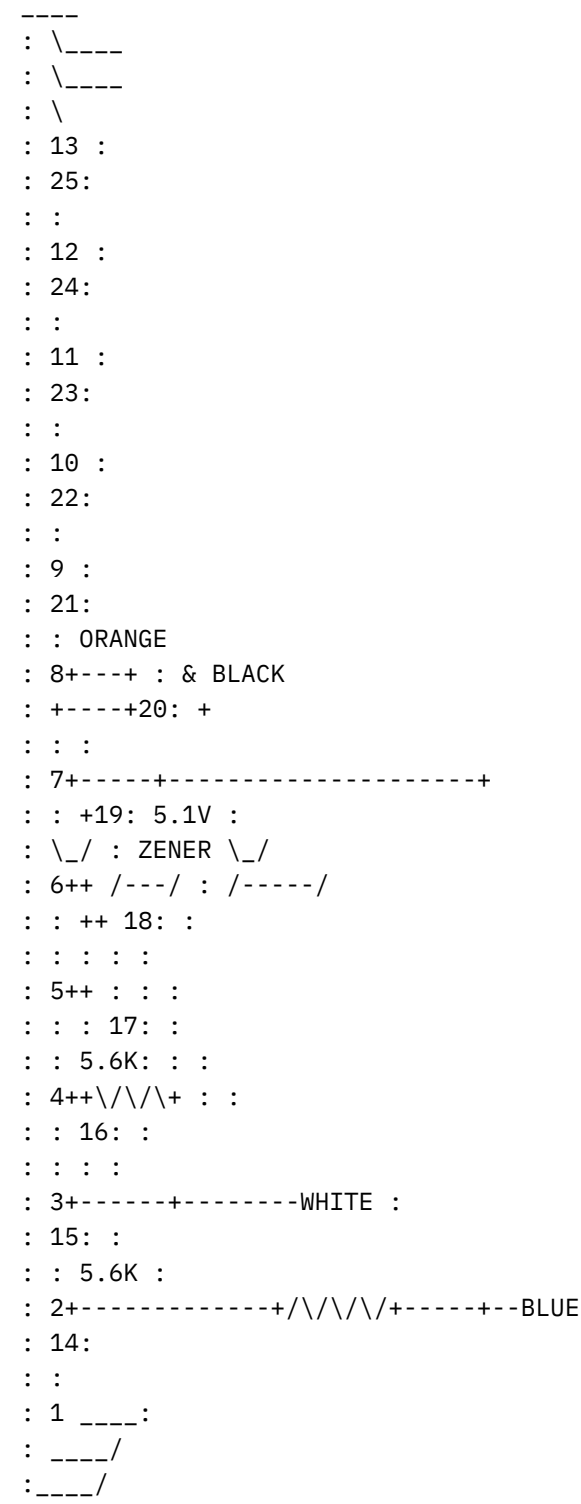
You absolutely have to use the circuitry to protect your 8-bit. RS-232 uses -5V to -15V and +5V to +15V for it's logic levels. The inputs are high resistance so it's OK to drive them with the +5V of the Atari, but if you input a -10V on a joystick port, there could be smoke & costly repairs.



The colors should be as follows:

COLOR	PIN #
WHITE	1
BLUE	2
GREEN	3
BROWN	4
ORANGE	6
BLACK	8

Explodo view for connection to FEMALE
DB-25



satile set-up. You could really make both types of cables
cheaper then you could buy a NULL connect

EXAMPLE #2 SIMPLE NULL MODEM FOR 1ST TRANSFER IBM=>8-BIT

This is just a quick and dirty transfer program I wrote. It uses
a slightly different cable & will work for getting a real
telecommunication program to the 8-bit. It'll transfer any file,
including binary, BUT ONLY TO THE 8-BIT!

First run this program on your IBM or clone to set the serial port
speed.

```
10 OPEN "COM1:300,n,8,1,RS,CS0,DS0" FOR OUTPUT AS #1
20 CLOSE #1
```

After running it type SYSTEM & hit RETURN For transferring stuff
you'll just run the Atari program;

RECIEVE.LST

Then use MS DOS "COPY FILENAME COM1". After the clone finishes
the transfer, just hit any key on the Atari to wake it up & save
the program. I had to shut the screen off to keep the timing
right. The IBM thinks it's just hooked up to a serial printer so
it'll dump the file as is.

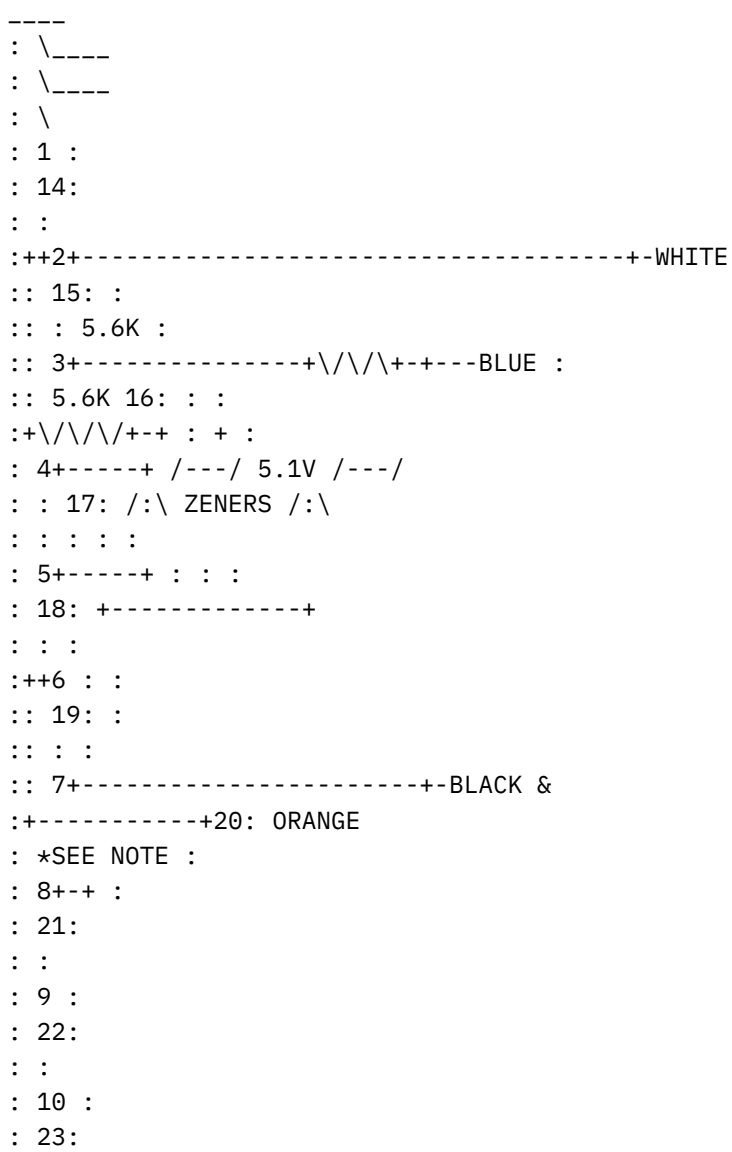
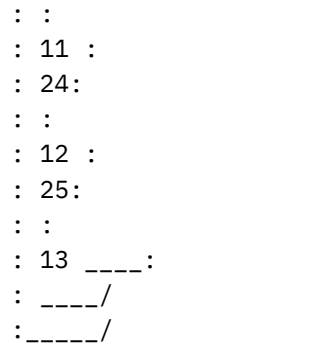
EXAMPLE #3

This is the one I really recommend building, if you buy a NULL modem connector you'll be able to use it to hook up with both computers & a modem.

Explodo view for connection to male DB-25

Solder side of DB-25 (I stick everything inside the hood)





*NOTE: Some printers use pin #8 as CARRIER DETECT. I believe the NEC Spinwriter is one. I never ran into any thing that needs it, but you may want to use pin #8 to #20 if you have a problem. In this case DO NOT CONNECT PIN #6! Maybe use the 4-5-6 connection. #6 and #8 are both outputs from DTE's so you could have one trying to bring the other to a +10 or a -10V! I've seen a reference that does this, but it doesn't seem like a good idea. Besides, the NEC uses pin #19 & maybe #20 for DTR and is such an odd case, it may not work anyway. If you use 5.6K resistors you could connect just about anything to anything, but why? If you buy a NULL modem for connecting your computers, it'll probably take care of the CD line anyway. As a final note; if you really want to be safe get a pin-out for the devices you want to connect. Make sure you never have two outputs from either device (or themselves for that matter) connected to each other.

Here's a list of standard pin assignments for RS-232 to help you along & double check my connections. *****NOTE***** I do connect pins 4 & 5 to pin #2 (or #3) through a 5.6K resistor. This is necessary because although the joystick port can deliver a 0V level, it can't drive a +5V by itself. You could probably also substitute pin #20 vs #4 for driving pins # 5 & #6 if you never want to connect to a modem.

3653. Re: Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-08 19:24:52 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <18ium4INN4nt@usenet.INS.CWRU.Edu>
Source record: 109598

In a previous article, UJ1G@DKAUNI2.BITNET ("Marek Tomczyk") says:

>
>Michael Current's FAQ contains:
>
>> 65XEM 65XE plus AMIE sound chip
>
>Hm, never heared of an AMIE sound chip. What is it exactly?
>Is it as good as the SID(?) inside the c=64?
>Is it possible to get the sound chip from somewhere and add it to
>my 130XE? How much does the AMIE costs?

That description of a 65XEM came from a 1985 issue of Antic (the issue before the one with the flying 130ST on the cover.). There happens to be this issue of Byte from March 1986, with a 1040ST on the cover, which contains an interview with Shiraz Shivji, Atari Corp. vice president of research and development at that time. Talking about future STs:

BYTE: What about sound capabilities?
Shivji: We had a project around here started during Alan Kay's tenure--a chip called Amy. And the ST was designed to have the Amy. But the Amy did not happen. We had silicon, the first pass, in Octerober or November[1985], and we had severe problems with it. It was kind of an orphan project. And if you have a chip that has six or eight people who have worked on it at different times, chances of the chip working are slim. But it's a good design.

BYTE: What does it do? What's so special about it?
Shivji: The approach of others is that during horizontal-refresh time you go out to some pace and put some memory out automatically , and that goes through a DAC and you have sound. Essentially you're sampling at 15.75 kHz, which is the typical frequency. So it's like a digital tape recorder. You have a digitized sound and you're just putting it out. And it needs enormous amounts of memory. The key is: How do you encode sound? From an information-theoretic point of view, there are two problems with this papproach. One is it's an anormous waste of memory. Because you could encode whatever sound you're going to play, as far as data is concerned in a sound piece, the data rate is extremely low. And doing it in the digital tape recorder way, you're wasting an awful lot of bandwidth and a lot of memory. The second problem with other implementations is that you only have 8 bits and it's not really that good. Especially with CDs coming out. Amy was a chip that had 16 bits of information coming out. So you could have 96 decibels of range. What you could hear! Amy was a complete digital sound chip. It's called an additive-digital synthesizer. It had an adder and 64 independent oscillators. It has a model for sound and you

feed it the parameters. But if you do that you have to do an awful lot of preprocessing. We had hired a lot of people. We had a VAX 780 devoted to it. We had equipment, fast floating-point array processors, and so on, to analyze notes. We would get a tape of piano playing and then the VAX would analyze it and would take the Amy model and give the parameters.. To play anything you only needed to have parameter tables and feed it to the chip.

The interview goes on a bit more, being even less informative. It ends with this ditty:

BYTE: So the Yamaha chip is in there just to give it the basic sound?
Shivji: Yes, just the basic sounds you need. Though, of course, the ports are very useful.

Sorry for any typos, I never looked up at the screen.

I assume this Amy is the AMIE that was for a 65XEM as well.

I read this group for informational text. If a binary file appears, it is just an annoyance to those who are not interested in it. When there is a text message that seems uninteresting, at least it is readable. With a binary newsgroup, one could just read the titles, then go back and save those messages/files that were desired.

3655. Help with 800xl

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-08 22:26:50 UTC
From: ccovatto@nmt.edu
Message-ID: <1992Sep8.222650.1183@nmt.edu>
Source record: 109474

I have an 800xl that diagnoses itself as having a bad rom. I agree
with it beacuse if I try to run a program, it doesn't work correctly. I have
tried pushing all of the chips back into their sockets. This seems to work for
about half an hour and then it stops working again.
What I want to know is where the rom chips are located at or preferably
the numbers on the chips themselves so I can try to find replacements for them.
Any help would be greatly appreciated.

Carl

I've never seen it for the 7800, but I happen to think the NES (yikes!)
version is actually VERY good. I could see where the 2600 version would
stink ;), but I still want it! Maybe I'll even get a 7800 for the hell
of it (I'm a TOTAL Galag addict as you can tell).

Ok... just for a rundown, here are all the Galaga's I've heard of:

Galaga - arcade (2600/7800/NES as well)
Galaga 2 - arcade (never actually seen one, but I'll suppose it was made)
Galaga 3 - arcade (I like 1 better ;))
Galaga'88 - arcade (pretty snazzy)
Galaga'91 - TG16 (pretty much '88, but made a few years later...it may
be called '90... yeah, probably '90)

These are all the Galaga's I've heard of...

let us not forget Space Invaders, tho ;)

Since we have C on the atari, why not use the Unix code as a basis, but
replace the pipe calls with calls to an atari uudecode program?

>terminator.cc.umich.edu, and only one file at atari.archive.umich.edu.
>I don't remember the name of the folder-- try using ARCHIE with the keyword
>k65.

atari.archive.umich.edu IS terminator! All K-65 files are in the
/atari/8bit/telecomm subdir.

>K65 has a software 80 column driver which looks fine on my Commie 1702
>monitor, but does anyone know if its Atari screen mode works with drivers
>such as the XEP80?

Almost. It runs and everything, but it mostly still thinks the screen is
only 40 columns wide. This produces a variety of weird behaviors, like
incoming clear-screen commands clearing only half the screen!

Those people that have been here a while may recall my begging for someone
to fix K-65 so it runs better on the XEP80. I gave up begging when I found
VT850 - a VT100/VT102 emulator designed with the XEP80 in mind. I'm on it
right now! I'd still like to the Kermit-65/XEP80 combination perfected
though, as K-65 is overall a more solid piece of software than VT850 IMO.

Of course you can be captured! The game wouldn't even be Galaga without
that! I think the "skills" Craig is refering are some of back doors and
cheats for the Galaga coin-op. They don't work on the 7800 version. And the
graphics are not totally the same (but they're close!). Overall, I
don't think you'll find a better 8-bit home translation, but I admit I
haven't ever played the NES version.

Speaking of Tempest and Galaga, did Gyruss ever make it to any Atari
platforms other than the 5200? I just got a copy for my 5200 and I'm
very impressed. What kind of controllers did the original coin-op use?

My biggest beef with Kermit-65 is the fact that it's scrolling tends to lose
lines of text when it tries to scroll the screen when the cursor reaches the
bottom. Could be that I'm using an older v., though. For VT100 you cant beat
V10^2. Pretty solid little program aside from a couple of bugs. I log onto
VAX with it all of the time.

I own the Gyruss cartridge for my old 800. Fairly good translation.
All of the original arcade machines I've ever seen just use a regular
arcade joystick and cherry-button.

I'm not some fanatical "FALCON RULES" maniac--we already have a couple
of those running around. But I do tend to think that speed is overrated,
that it is looked upon as the answer to all our computing problems.
I've used text editors on an 8086-based PC which I much prefer to the
one I'm using right now on a Sun workstation. It's the same way for
everything--just upping the processor speed doesn't make software any
better. (The famous "gcc" doesn't compiler any faster than ol'
Deep Blue C on my 800. This is a meaningless example, but something
to think about.)

I find that most processors have a whole lot more speed than I'll
ever need, and I'm talking about "slow" things like the 80286 and
68000. A 16 MHz 68030 may not be the current state of the art, but
it isn't exactly a slouch either (and that's a severe understatement).
It is looked upon as underpowered, though, because it is common in
the MS-DOS world to throw around all sorts of meaningless statistics
and impressive sounding numbers.

[If megahertz is the sole indicator of computer power and usefulness,
then the Atari Classics staff might as well call it quits...]

The Falcon is to be Atari's new LOW-END machine, replacing the 8-MHz STE.
The announced list price is comparable to a 16-MHz 386SX.
Atari already makes the TT which runs at 32 MHz, and don't forget: 16 MHz on a 68030 is not the same as 16 MHz on a 386.

No, I wasn't talking about any cheating stuff. I mean limits that are mostly due to the difference in resolution. For instance, the shots move a lot slower, so you pay a far bigger price on the 7800 version than you would on the coin-op for misfiring. Also, the distance between the shots of combined ships (following a capture) is such that you can't sit still and finish off the challenge stages (at least the first one), like in the coin-op.

>Speaking of Tempest and Galaga, did Gyruss ever make it to any Atari
>platforms other than the 5200? I just got a copy for my 5200 and I'm

The 2600 version by Parker Bros. is decent. Before I had tried it, I was expecting it to be atrocious, like the 2600 Zaxxon. The 2600 Gyruss is excellent! The only thing it lacks is the ability to shoot enemies while they are at the very center.

3676. PC to ATARI File Transfers (CHEAP!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-10 01:20:32 UTC
From: thester@nyx.cs.du.edu
Message-ID: <1992Sep10.012032.11157@mnemosyne.cs.du.edu>
Source record: 109472

Here is a way for those people without a double-
density drive for the Atari to transfer files
from a PC to an Atari 8-bit. (810 drives or
stock 1050)
This method _does_ require that you have a modem
for both machines.
I used to do this a couple of years ago before
I discovered the 'util' programs that are for
transferring files via a MY-DOS formatted double-
density disk with a PC's 360K drive.
I used both BobTerm and 1030 Express! with my
1030 modem. My PC uses Telix.
You will need three lengths of telephone line
with a RJ11C connector plug at each end and one
'Y' adaptor plug (splitter).
Hook things up as per the following:

```
---- ----
PC ----------------------------------- Atari
---- ----
\ /
\ /
\ /
\ /
\ /
\ /
\ /
\ /
\ /
\ /
\/
Splitter at Phone
Jack (wall plug)
```

Hook the PC modem to the Atari modem via the 'line'
jacks or the 'to telephone' jacks.
From the splitter at the phone jack, run a wire to
each of the remaining jacks on the PC and Atari
modems. This will provide the needed 'carrier'
that a modem requires for its signal.
Boot your comm programs on each computer.
With the comm program of each machine, set one to
'originate' and the other to 'answer'. Follow your
comm programs instructions on establishing the
connection. NOTE: On some telephone systems, when

you attempt this, it will disconnect after a short time. (NO CARRIER). This is because some systems have an automatic "alarm" to draw attention to the fact that you have left the phone off the hook. This is actually what you are doing when you use this method. It then "hangs up". To get around this, you need to have a phone hooked up to one side of the line from the PC to ATARI line connection. Yes, you need another splitter. Hold that phone 'off hook' and listen to the nice beeps and buzzes that the phone company so nicely provided to keep you from accidentally leaving your phone off hook. Wait until it is completely through having this fit, and then while still holding it off hook, establish your connection as outlined previously. Once the two computers are connected via your comm software, go ahead and put the phone back down. They will now be properly 'connected'. Make sure your parity and duplex are set properly. Type a word from each keyboard and see that the other responds in the same manner and that one keyboard is not producing 'echoed' lines of your text.

Now you can tranfer files between the two computers using whatever protocol both comm programs support between the two. Just like you dialed up your favorite BBS, this method will only transfer the files at whatever baud rate your receiving modem can support. 1030, 835, and XM301 modems only support 300 baud. This is a very slow way to transfer files, but IT WORKS.

I have used this method many, many times in the past and there was no damage to either my modems or computer.

You may have to 'play' with the arrangement in order for it to work properly. For example, if you have the two modems hooked together via the plug marked 'line jack', you may have to change so that they are hooked together via the 'to telephone' plugs. The lines from the splitter will of course go the the remaining plugs.

This is an economical way to do things as compared to the cost of finding and buying an XF551 double-density drive or a modified 1050, or some other 3rd party drive. It is also cheaper than a 'null modem' cable arrangement but not as fast. No 850 interface or equivalent required.

While I emphatically state that no damage was done to any of my equipment, I will not be responsible nor take any responsibility should things turn out differently for you.

Modems were designed to hook up to telephone lines, just not in this manner. The principle is still the same though and there should not be any problems as a result of doing this.

For best results on the Atari side, you really should use BobTerm.

Good Luck!!

To connect RS-232 devices to the Atari is to use either the Atari
850 or P:R:Connection interfaces. That would be the simple way.
There are no other circuits that you could really hack to change
the SIO output to RS-232.

The R-Verter changes SIO to RS232 using only two chips plus assorted resistors. The circuit board is so small it fits inside the shell of the modem's DB25 connector. BTW, I have one for sale, if anyone's interested... ;-)

BTW: Someone else did something like that, but just used a 9V battery
to replace the voltage out of the phone jack, 'don't remember the
polarity, but I think it was just a two line cord between the computers
with the battery across the line.
While I'm on the topic of connections; I finally found my xl schematic after
being missplaced for a year or two. To my suprise the NOT CS lines for
The $D600 & $D700 areas are already decoded! In other words, if you just
want to map a chip like a 6551 or 6520 into the system, the decoding is
there so you just have to pick the right pin off the 74LS138 for !CS. What
was even more interesting for me was the way the 74LS138 was implemented you
could easily bend out 2 pins, piggy back another '138, attach just two
address lines & end up with all the existing hardware chips decoded to the
bottom half of their memory page & add up to an additional 8 devices. I don't
know of any software that doesn't use the first available address vs the
repeated locations so it should be safe. Anyway, if anybody wants another
'verbose' how to for it, let me know.

3681. xm301 conversion?

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-10 20:24:15 UTC
From: bsmorgan@sdrc.COM
Message-ID: <2011@sdrc.COM>
Source record: 109481

Hi netters -
I have an old xm301 modem (I think) on my 800xl that still works fine,
but v-e-r-y s-l-o-w (about 300 baud!). Is there any way to speed it up
by replacing a clock chip, or something? As many have already pointed
out, it's hard to spend hundreds on 850's and modems, for old hardware.
Has this been done?
Thanks,
Brian

ARRGGH! Soap Box Attack. From what I've read the Falcon can also do a
true color mode & can overscan to use a 20 or 30% better rez. Just what
do you think the higher rez's of Super VGA get you? It's really not the
way to get a realistic picture. For instance, broadcast tv is only something
like 525X525 interlaced (it may be lower, but I know it's not more!). It's
academic for anything other then looking at nudie GIF(s) anyway since most
software houses only support the 256 color VGA mode anyway. I'm pretty sure
I won't get a Falcon, ST is fine for most stuff, but it should compete
on equal ground with any 386SX & would probably give some straight 386
a run for their money. Certainly for some applications a 16 mHz 68030
should be as fast as a 25 mHz 386SX.

3684. AACE Meeting Announcement

Newsgroup: comp.sys.atari.8bit

```
-=< MEETING ANNOUNCEMENT >=-

AUSTIN ATARI COMPUTER ENTHUSIASTS (AACE)

WHEN: Saturday, 12 Sep 92, 1400 - 1700

WHERE: Bethany United Methodist Church in Anderson Mill
(on Anderson Mill Road just southwest of US-183 intersection)
Bethel Building, Room 5

WHY: Presentation by Tim Gallivan

If you are an Atarian in the Austin area, you don't want to miss this one!
Tim Gallivan, a Postdoctoral Fellow in theoretical physics at UT, will be
giving us an opportunity to see an Atari ST do things many of us were un-
aware were even possible. Tim's machine started life as a 520STf, but now
sports 4 MB and an AT case with DEC LK201 keyboard. The foreign case also
houses his two floppies and 85 MB hard drive. Tim is responsible for port-
ing Ghostscript, a PostScript language interpreter, to the ST platform, and
for writing a GEM shell for it. In addition to Ghostscript, possible demon-
strations include: MiNT, CS-TeX, and Unix Windows (only if we can rig access
to a phone line). Y'all come!

As usual, we will also have available our ST and 8-bit libraries.

Please don't compare clock speeds between CPU types as an absolute indicator of whether one is faster than another. You also have to look at what each CPU accomplishes during a clock cycle. This is true even within the Intel family. A 25MHz 80486 gets a lot more done in one clock cycle than a 25MHz 80386SX, for example. As I understand it, the Falcon runs with a Motorola 68030. You can't compare it to a 50MHz Intel chip only by clock speed and say anything meaningful.

So far as I understand things, there is no reasonable way to "speed up" your modem beyond 300bps. I believe different frequencies are used for 1200bps (and higher). So you would have to not only transmit faster, but also change the audio frequencies to be compatible with any other standard modem.

3689. Re: PC to ATARI File Transfers (CHEAP!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-11 16:42:21 UTC
From: potter@sunny0.dab.ge.com
Message-ID: <1992Sep11.164221.26869@ge-dab.GE.COM>
Source record: 109484

As long as everybody is telling their favorite ways to download from Internet->PC->Atari, I might as well give mine.

The Internet feed comes into a network of Suns here. I can either use ftp or remote login from a PC to get to the Sun network. I can then list the file (if text or .uue) and capture that to a 5.25" disk on the PC.

At home I have CSS's XF551 upgrade (but only a 5.25" disk). This includes a program to read IBM or ST files directly (which only works if you have the upgrade installed). So I convert them at home to ATASCII files, which I can uudecode if they were binary to begin with.

The upgrade can be ordered with a 3.5" disk drive, which makes it easier to find a PC with the right size drive.

3691. Adding a 2nd PIA

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-11 22:30:01 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <65693@cup.portal.com>
Source record: 109485

Well, I finished what had to be the quickest/easiest hardware project I've ever done. This isn't the best way to implement additional functions to an 8-bit, but I mainly did it to make sure the (M)emory (M)anagement (U)nit sends out the proper signals for the mod I have in mind. Since it adds and additional 6520 with it's 16 I/O lines & interrupt capability it may be enough for someone who just wants to do [robotics, home control, memory expansion, ...]. A bit of background on the Atari Memory Map. The way Atari implemented the hardware was to decode the address & use that to select the chips to be loaded or read on the data bus. It's the MMU that takes care of things like switching basic on or off, reading the joystick ports etc. For any memory access in the $D000 to $D7FF area, the MMU puts an enable pulse to a 74LS138. The 74LS138 is an decoder that selects one of 8 possible outputs depending on what is on it's address pins. In the Atari case, they tied address lines A8, A9, & A10 to the address pins so when the smallest unit of measure is 256 bytes with respect to the address bus. Eight possibilities from 3 address lines =>2K of hardware. This is the hole you always hear about when people ask why we can't access the entire 16K of ram under the OS. Why didn't they just use address lines A5, A6, & A7? I don't know, but it would've saved 1.8K of space. As it turns out, they probably did us a favor since it makes adding additional chips trivial. Like I said, the 74LS138 is a one of 8 decoder, but have you ever counted the LSI chips in your computer? Antic & the CPU take care of themselves, so the only lines that are used on the 74LS138 are O/0 for GTIA @ $D000, O/1 @ $D100 for the enhanced cartridge interface on the XE, O/2 @ $D200 for Pokey, O/3 @ $D300 for the PIA, & O/5 for the cartridge control line. Antic decodes it's own stuff @ $D400 thank you! Outputs on pins [4, 6, 7] aren't used anywhere on anything. Since this is a minimal project, I just used the O/7 (pin #7 of the 74LS138) for the project. This mod was done on an 800XL, but should work for a 1200XL or XE. Buy any one of the following; 6520, 6521, 6821. I left the input pins CA1 & CB1 tied to the existing 6520, this should prevent spurious interrupts. As far as I know, PIA interrupts are not used by anything, but if someone every uses them, the software may have some trouble clearing the 2nd 6520's status. Bend out the following pins: [2-17, 19, 23, 39]. Piggy back/solder the remaining pins to the existing 6520. Run a wire from pin #7 of the 74LS138 to pin #23 of the new 6520. That's it! Pins 2-17 are the PORTA & PORTB I/O pins respectively. What I did to check out the circuit is wired a single 220 Ohm resistor to the +5V supply on pin #20 of the 6520, then ran LEDs from it to each of the bent-out pins of PORTA. To

run it through it's paces just:

```
10 PORTA=55040:PACTL=55042
20 POKE PACTL,0
30 POKE PORTA,255
40 POKE PACTL,4
50 FOR N=0 TO 255
60 FOR DELAY =1 TO 300:NEXT DELAY
70 POKE PORTA,N
80 NEXT N
90 GOTO 50
)
4 REQUEST TO SEND (RTS)
20 DATA TERMINAL READY (DTR)
23
```

3692. FREE ADS IN ATARI CLASSICS

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-11 23:24:14 UTC

Message-ID: <9209112324.AA00999@smithkline.com>
Source record: 109486

Well, I reckon I overwhelmed everyone with my previous posts about the free ads in AC (aka "Swap 'n'Shop"). Response wasn't what I'd hoped for, so I'm gonna try again. A little more laid-back this time.

OK, here's the deal. You get to place a free ad in AC whether you subscribe or not. Up to 50 words, which must include your name & postal mailing address. Buy/sell/trade. Anthing related to Atari 8bit stuff. Announcements of BBSs, usergroups, sales of software from club libraries, seeking info for social contacts w/other 8bitters in your locale, 2600/5200/7800 videogame stuff, whatever is your thing.

If you wanna include a phone number or email address, that's cool. Just keep it under 50 words.

We consider a "word" as any combination of ASCII characters separated by a space. If you're real creative, you can do a lot with that.

Deadline for ads is: SEPTEMBER 20, 1992 if you want it in AC's Premier Issue.

Hurry! There ain't much time left!

Send ads to me at:

Internet: poehland%phvax.dnet@smithkline.com
GEnie : B.POEHLAND

Snailmail: Atari Classics
179 Sproul Road/Rt. 352
Frazer, PA 19355 USA

On CIS or Delphi, send your ad to our Telecom Editor, Lawrence Estep, at:

Delphi: LESTEP
CIS : 71450,1050

I know EVERYBODY out there gotta have something they wanna buy, or some piece of junk they'd like to sell off or trade away for someone else's stuff.

I personally am a firm believer in the philosophy that one man's trash is is another man's treasure. Heaven knows I've bought enough of other people's trash at shows & stuff. And given my own in return. Makes everybody happy :).

And it ain't gonna cost yah nuthin'!

Hey folks,

Just got back from watching the movie Sneakers. It was very good! I
can't think of anything I didn't like about it. That's saying something!
Go watch it...

What does this have to do with Atari? Well, if you look closely, you'll
see a cameo appearance by an old Atari 830 (I think) acoustic modem.
Really!

Bye!

Just a non-verbose addition: Just got through wiring the 2nd PIA to a
Citizen 120D printer. I haven't wrote/won't write a handler, but the wasy
I have it set-up for a 7 bit character you just poke PORTA with the character
then the character+128 to toggle the printer's Data Strobe line. It could'a
been done with 8 bit data, but I was just fool'n around. I'll do the 6551
@ $D600. Total parts for adding a real centronics printer interface & a
19,200 baud RS232 port should be less then $15. BTW: the BUSS is the only
way to go for RS232, That way you don't have to kill concurent mode during
disk access. I just have to pick a good chip to mount the 6551 on top of.

Ok..Say I wished to design a "real" terminal program for the atari 8bit.
Let us go so far to say that it only supported the XEP80 card..
1) is the xep (in burst mode) able to handle above 2400 baud?
that is a modem at 2400 baud...
2) Where can I get (online) a complete technical manual on vt type
terminal commands? and others....
3) Are the screen control commands standard to the VT emulation
or are they ANSI commands...as in ...If I log on the the FREENET
using vt52..or 100...things are underlined...highlighted...spaced..
are these standard terminal commands or some protocol on top of
the standard vt100?
4) Where do I get a list of those commands?
5) Does anybody have missing characters using bobterms vt52 at 2400 baud?
6) Reason being...I would like to have a nice 80column term program capable of
doing what "I" want...and with 256k memmory is noooo problem!
7) Now...who wants to write me a Kermit handler for 1000 byte blocks?
8) Zmodem...now there would be something nice...any code laying around
on other machines in C or Pascal or Fortran? that stuff is real easy to conver
t.

>Ryan (insomnia@u.washington.edu)

I wouldn't worry too much about it. I used an sx-212 for years, and
never had a manual for it.
The SX-212 is (reasonably) hayes-compatible. Any "standard" hayes
commands such as ATDT, ATA, ATS0=1, etc. will work fine.

What I would recommend (and what I did:) find someone who has a manual
for ANY Hayes-compatible modem, and look at that. Most of the commands
will work.
Also, if you want to know what the lights on the case mean, it's the
same as other external modems. HS is high-speed (1200 in this case), AA
is auto-answer, CD is carrier detect, OH is off hook, RD and SD are
receive and send data, TR is terminal ready, and MR is modem ready...
(sorry if that's elementary knowledge, but I would have loved for
someone to tell me that when I had my SX-212, since it was my first "real"
modem (meaning faster than 300 baud...))

I'd reconsider the decision to tie away the handshake lines. -STROBE/BUSY are exactly the kind of thing they're good for. Then you could whip up a print buffer (a la the MIO's spooler) that runs efficiently in the background.

> Total parts for adding a real centronics printer interface & a 19,200 baud

I suppose SCSI/SASI could be done with a bunch of software, but it's kinda stretching things. You'd certainly want to hook up the IRQ and burn a new OS. It would be a challenging hack... a MIO or BB makes a lot more sense if you just want to get a HD going.

ANSI is much like VT100/102, but with some extra stuff added. I don't have the reference document, sorry. Beware of working from MSDOS ANSI.SYS documentation, as the typical PC ANSI is an incomplete implementation.

> 7) Now...who wants to write me a Kermit handler for 1000 byte blocks?

Doesn't that violate the Kermit standards?

> 8) Zmodem...now there would be something nice...any code laying around on

C source for Zmodem is all over the place. I can mail you a copy if you want. However, keep in mind that streaming protocols like Zmodem are useless unless you can interleave serial I/O and disk I/O. A ramdisk is ok; otherwise you'll need a bus serial port like a MIO, BB or the 6551 hack Rick is talking about.

I HATE!@#$ PIGGY BACKING CHIPS! Almost every time I do it, I ruin both chips! That's a major reason why I picked the 6520, it's cheap & everywhere if I blew it. Try finding an ANTIC at your local Radio Shack <G>. Just mindless ramblings, but... I consider myself a true hobbyist => I do things I don't really need for reasons no one else can fathom. I've got two direct connect printers for my 8-bit as well as an 850 & P:R: connection. I just like the smell of solder & saying "Atari should have done it this way!" Intellectual honesty makes me do it before I say it. For Ex. if Atari would've spent the extra $3 for the 2nd 6520 & $.69 for a connector they could've had a built in printer port plus about another spare 8 lines. Say you use two for a feable RS232, you still have 6 left for bank switching & all four original joysticks. I think the lack of a printer port really hurt sales/functionality of the system. It would've added 1% to 3% to the cost of a system, but made them much more suitable for light WP etc. Some of the other stuff I regard as near sighted was not tying the A7 line to the 74LS138's other !E line & perhaps spending the extra $.20 to add a 2nd '138. You sort'a have to remember: I'm really not that bright & have never had a single electronics class of any kind. If I can sit here and figure it out, it makes me wonder what was going on at Atari.
Anyway, I'll keep plodding along. If you guys are following my chain of thought, you'll probably guess where this is going.

3705. Re: Adding a 2nd PIA

Newsgroup: comp.sys.atari.8bit

Source record: 109499

Reading your first post forced me to dig up my schematics and check this out.
Pretty nifty, I concur with you said.
But it seems to me, all you need to do to add the second 74138 is pull up
G2B' and tie it to A7. Also tie A7 to G1 on the second 74138.
G2A' on the second PIA can be tied to G2A' on the first, G2B' on the second
needs to be tied to ground.

Charles Hughes approached the PIA upgrade a little differently,
taking CS2' from the 74ls138, and running that to the enable line of
a 2 to 4 decoder. Then the outputs could be run to 4 PIA chips, which
cut $D300 into 4 blocks, one block for each PIA.

The easiest way to make a bulletproof driver for the PIA to printer port
mod would be to modify the P: driver in the OS ROM. This would require needing
a EPROM burner of course, but then the printer port would even work with
PrintSHOP and stuff.

Another way to approach the modification, if you have lots of different
OS chips you use, like the Ultraspeed OS, and other 800XL operating systems,
is to build a Parallel Bus type card instead. You need a lot of TLL chips,
and still need to BURN a ROM chip which contains the Printer driver, but
it would work.

I would really be interested in a 6551 upgrade, and someone to write
the R: driver for it. I managed to get documentation for a 16550,
which is a really fancy RS232 chip. This chip can buffer up to 16 bytes
of incoming data internally, which means it would make it easier
to push the 8 bit to faster modem speeds. If anyone is seriously interested
in this, I can provide a copy of the docs upon request.

Regarding Hard Drives, Bob Woolley is currently working on an IDE
hard drive, hooking it up to his 8 bit. I think implementing IDE
is easier than SCSI or something.

Well..I know of someone (2 now maybe) who are working on hooking up
IDE drives. Very simple...except that darn 16 bit bus...thats the problem.

Indeed! However...with ramdisk...is probably going to be the easiest..
there is no way this thing is going to work without extra memory! maybe if
phillip price did the codeing...but.

I would like that C source if you would and any others for other protocols(ju
st happened to get a legal copy of Lightspeed C!) In addtion...source for ansii
nformation.Maybe I should conntact the author of Ansi Term..but..
I have never ever gotten those program versions to run on my setup.

Also
KERMIT-CMS 4.2.3 can go to packet lengths of 2039 bytes.

In regards to all the upgrades available for the 8bit..
Transkey...stereo...multiple PIA's printer and serial ports..memmory..
Um...how difficult would it be to draw up the prints for a new 8bit?
First of al you already have them for the xl/xe/800 line....
and adding a few chips is not problem...there are even circuit design
programs out there that will do the tracing for you..now..
how about a limeted production of these new silked boards? Say
small enough to fit in a baby at? I have everything in there right now
except my mio..which is undergoing repairs.

While we are at it...since SOME PEOPLE do have the 1450 prints...
um..why not a parallel drive?
First of all, all the chips are atari's..still can get 'em. The only
problem would be the 1450 drive os and its speach...
Is it Illegal to modify a copyrighted schematic and reprint it?
Who is to say that you just didnt decide to hook those chips up
the way you did?

ALSO I PRESS FOR EVERYONE OF YOU TO BUG THE heck OUT OF ATARI TO
RELEASE THEIR DOCUMENTED SOURCE CODE FOR THE XL ROM's. ALL 500+ pages of it!

Andrew

3710. "OPERATION: A.C.T. NOW" announcement

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-12 22:37:14 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <18treqINNj80@usenet.INS.CWRU.Edu>

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.palmtops

```
"OPERATION: A.C.T. NOW"
======================

Atari Community Together Now
----------------------------

Campaign Organizers:

Len Stys, J.J. Lehett
Mark Leair

Sponsored by:

The Cleveland Free-Net Atari SIG

September 12, 1992

INTRODUCTION
------------

"OPERATION: A.C.T. NOW" is a series of campaigns that will
help increase support for the Atari 8-Bit computers, ST/TT/Falcon
computers, the Portfolio palmtop computer, and the Lynx handheld
video game system.

Atari Corporation seems to be serious about the future...
If you would like to help increase support for Atari products,
you can by participate in these campaigns.

Who benefits? Everyone benfits. Atari users get more out
of their investment, developers sell more products, dealers sell
more products, publishers sell more magazines, and Atari
Corporation sells more products. If you are a shareholder, your
stock may go up in value.

There will be campaigns that focus on increasing suport for
the Atari ST/TT/Falcon and campaigns that focus on increasing
support for the 8-Bit Atari, Lynx, and Portfolio. The campaigns
that you participate in are entirely up to you.

These campaigns will hopefully result in a stronger Atari
Community.

If you don't wish to help Atari Corporation, participate in
these campaigns to help yourself. You will enjoy your Atari
products more by greater support!
```

Cost?

There is no cost to you in any way to participate in these campaigns. There is no registration fee and no donations are being accepted.

Members Key to Success

The number of people participating in these campaigns are extremely important. The news of these campaigns must be shared with every member of the Atari Community that you know. "OPERATION: A.C.T. NOW" should be publicized in Atari publications, at user group meetings, and at Atari dealerships. If you take action, we can make a difference. If you sit back and watch, we won't do anything.

+------------------+
| CAMPAIGN ONE |
+------------------+

The first campaign will be to compile two lists. One list will consist of things that we believe the company is doing right. Atari is doing great things and if you want to continue seeing the company doing these things, you have to let them know. The other list will consist of things that we believe the company can do better. The company will never know the problems that you see unless you tell them. We will send these lists to Atari Corporation's Board of Directors and ask that they consider our suggestions. Will Atari listen? There isn't a successful company around that doesn't listen--especially to their customers, developers, dealers, and publications.

What you need to do is write down everything that you see right with Atari and the things that you believe the company can improve. Include any past experiences that you have had with the company.

Here are a few examples:

RIGHT IMPROVE
Users
----- Great products, No easy memory
great price upgrade

Once took 4 months
to get my computer
replaced when sent
to Atari

Developers
---------- Good developers Took 3 months to
area on GEnie get a computer to

develop on

Great computers Atari was rude to
to develop on me when they first
showed me the Falcon

Dealers
------- Good dealer Shortage of products,
support even today

No new products

Lack of advertising

Publishers
---------- Atari advertises Slow to pay for ads
regularly

Does not give enough
new info to us

The comments made in these examples should not be taken as truth. They are simply examples. Also, your comments can be as long as you want. In fact, the longer and more detailed, the better.

If you wish to remain anonymous, you may send these lists in another envelope.

The goal of this campaign is to inform Atari of things that we believe can help improve the company's position in the computer marketplace.

All of the lists that are received will be compiled and then sent to Atari Corporation.

```
+------------------+
| CAMPAIGN TWO |
+------------------+
```

The second campaign is to concentrate on letting computer publications know that Atari is back.

The Falcon 030 will be announced at the Boston Computer Society meeting in a few weeks. We should let the media know that we would like for them to cover it. The amount of press the Falcon receives will most likely determine when the Falcon will be shipped to the United States and how many are shipped.

What you need to do is list names and addresses of publications that you wish to see cover the Falcon's release. These include magazines, newspapers, and televison news programs.

You should also lists computer publications that you wish to see support the Atari ST and Falcon computers.

This information should be sent along with the "OPERATION:
A.C.T. NOW" registration form.

Since the Boston Computer Society meeting is on September 23rd,
we are asking you to send us this information immediately. You may
ONLY send this information through E-MAIL if you are able to at:
"xx004@cleveland.Freenet.Edu". Please send any other information
through the U.S. mail.

OTHER CAMPAIGNS WILL BE ANNOUNCED
AT ANOTHER TIME

THESE INCLUDE:

8-BIT, LYNX, AND PORTFOLIO
CAMPAIGNS

The Cleveland Free-Net Atari SIG is the official site of
"OPERATION: A.C.T. NOW". If you wish to add any information or
discuss anything related to this campaign, a special section has
been created specifically for it.

The Atari SIG can be accessed by the phone number "216/368-3888"
at either 300, 1200, or 2400 baud. It can also be accessed by
users from around the nation or world for free by using "telnet" at
their college or business by the following Internet addresses:
freenet-in-{a,b,c}.cwru.edu = hela.ins.cwru.edu = 129.22.8.38
Type 'go atari' at any menu.

The Cleveland Free-Net Atari SIG's U.S. mailing address is:

Cleveland Free-Net Atari SIG
P.O. Box 364
Mentor, OH 44061-0364

The Cleveland Free-Net Atari SIG's Internet e-mail address is:

xx004@cleveland.Freenet.Edu

"OPERATION: A.C.T. NOW" is in no way affiliated with Atari Corporation.
These campaigns are organized by individuals that have an interest
in Atari products. The "Atari" name, logo, and any other Atari
products mentioned are copyrighted by Atari Corporation.

Isn't it amazing how in the U.S.A. these "grass roots" campaigns to increase ATARI awareness in the major media outlets --JUST HAPPEN-- to spontaneously occur whenever ATARI is launching a new product ? What a coincidence! Do you all remember: "THE REVOLUTION" ?

3712. Re: Adding a 2nd PIA

Jeff: Exactly! You'd be killer on Jeapardy. Chuck's stuff is good, but for simplicity, one piggy backed chip & one jumper has got to be simpler. The 2nd '138 so you can add 7 more devices is IMHO the right way to do it. I was "IFFY" on some of the other BUSS ideas I was throwing out, but this seems "RIGHT". Heck, you only need 8 data lines, lower 8 bits of address, and some glue signals W power. I just spent $130 for a burnner that's just a couple of PIA's with some voltage regulators & a ZIF socket.
BTW: I'll still admit you're right with the 16550, but like I said, I'm a little lazy for doing things right. I will write a R: handler for the 6551 when I finish it. Would've been this weekend, but my nephew's in the finals of some batting contest before the Oakland's A's game so I'm out of here!

Hello all, welcome to a new version of the
Classic Atari Cartridge List, v.3.0
A few changes have trickled in since the last post, and I
have reformatted the list somewhat to make it easier to mechanically
sort and resort.

As always, additions & corrections are welcome. I would particularly
like to see the serial numbers for the Activision carts sent to my mailbox.
I know someone out there on the net has them, since they occasionally
get mentioned.
By the way the current cart count is at 316 (and rising ;-))

Activision CZ-002-04 1983 Kaboom!
Activision CZ-003-04 Mega Mania
Activision CA-012-04 Space Shuttle
Activision Beamrider
Activision Decathalon
Activision H.E.R.O.
Activision Pitfall
Activision River Raid
Activision Zone Ranger
Activision 1984 Keystone Kapers
Activision 1984 Pitfall II
Activision 1984 Zenji (a maze type game)
Activision The Designer's Pencil
Activision Dreadnought Factor
Activision Pastfinder
AdventIntl Rally Speedway
Atari CXL4001 1979 Educational System Master Cartridge

In a previous article, Rick_Michael_Cortese@cup.portal.com () says:

>Jeff: Exactly! You'd be killer on Jeapardy. Chuck's stuff is good, but
>for simplicity, one piggy backed chip & one jumper has got to be simpler.
>The 2nd '138 so you can add 7 more devices is IMHO the right way to do it.
>I was "IFFY" on some of the other BUSS ideas I was throwing out, but this
>seems "RIGHT". Heck, you only need 8 data lines, lower 8 bits of address,
>and some glue signals W power. I just spent $130 for a burnner that's just
>a couple of PIA's with some voltage regulators & a ZIF socket.
>BTW: I'll still admit you're right with the 16550, but like I said, I'm
>a little lazy for doing things right. I will write a R: handler for the
>6551 when I finish it. Would've been this weekend, but my nephew's in the
>finals of some batting contest before the Oakland's A's game so I'm out
>of here!
>

Rick,

Hmm, There is a basic design for AN EPROM burner that came with the
Microport XL experimenter's kit. I could expand on it, but what
bothers me the most, is how to allow different sized EPROMS as part of the
BASIC design. Different EPROM sizes may have different numbers of pins,
thus meaning you have to pipe +5 and GND and the other signals to the
proper pins on the ZIF socket. I have been bothered by how that is
implemented.

I would really like to see someone use the 16550 in an RS232 port for the
8 bit. I can't afford to do it myself, either in terms of time or money
right now. I could probably do the hardware, but I am not good at
writing system level drivers, like an RS232 driver.

What you could do, wire in a 3/8 decoder to A7, A6, A5
with the original PIA enable enabling the second 3/8. That way,
you have 8 devices mapped in the $D3xx region.
Use 4 7474 Dual D flip-flops mapped as one 8 bit register at
$D1FE as an IRQ register. Tie the S lines to the IRQ's of each
PIA or other device to be mapped at $D3xx, ORING all of the
Q outputs together and send that to the IRQ of the 6502.
Wait, IRQ is pulsed isn't it? You would have to make it a one-shot or
something like that. No big deal. The BASIC concept being
that you read $D1FE to see which device caused the interrrupt, and then
clear that bit so that the IRQ handler doesn't get confused if another
device IRQ's at about the same time the first device did.

Putting 8 devices in the $D3xx region isn't so bad, each one has 32 bytes
of address space, which is plenty for most devices like PIAs and UARTs

and stuff, maybe not all the registers of a 68881, but that's another
story altogether anyhow.

I think if you start adding a lot of extras, you should buffer
the lines, and but a transceiver on the data line to buffer it as well.
I doubt you could put 8 devices mapped anywhere without causing a bus
failure or something.

From: BRACHOT.JCT.AC.IL!bruck@ucbvax.berkeley.edu (Itay Chamie1)
[...]
And now.. I didn't get any replies to this: Do you think binary postings
to c.s.a.8 should have a subject header of "zzzz [progname]" to prevent
Digest readers from getting annoyed? Whaddaya say add it to the FAQ
or sumthin'??

You're missing the point. If you post binaries to the discussion group,
regardless of subject, they end up in the digest, and force digest
readers to either slog through lots of crud they don't want to see, or
cancel their subscriptions.

Please don't post binaries to the discussion group.

Dear Netters,
Back in eighty something, ANTIC came out with an ascii-to-graphics converter which would convert ascii pictures to GR.7. Well, is there ANY way to go in the opposite direction? Would an optical character recognition (OCR) program fit the bill if I scan in the image with a scanner? Also, does anyone know on any ftp site where I can find more of these ASCII pictures? Your help/advice is greatly apreciated. Thankyou.
Below is an example of the ascii art that I refer to. If you wish to respond on the NET, please edit out the picture so as not to waste bandwidth.

Well... The reason I'd do it the way I'm talking about is 1) Chuck had to use either 74HCT or 74F, I believe, in order to get the circuit fast enough to respond to the delays with the added circuits. I'm not that good at trouble shooting so it has to work right from the 1st time it powers up. As long as the !CS lines are used, the number of chips on the buss shouldn't really matter much: They'd be in the high impedance state. I figure if I don't want to add delays through gates I have to keep the 2nd '138 at the same level as the 1st. 2) If anybody really want's to add aditional decoding to the page, it doesn't bother me <g>. IMHO: Perhaps add a single buffer element between the MMU & the MANY '138s. I'm not sure what the fan out is from the MMU to the '138s is, but a single fast buffer would let it handle multiple '138s. Like I said though, I'm not too worried about it. Really, How many things would you add if you could? I'm thinking maybe built in RS232, printer port, maybe an Eprom burner, true A/D, two PIAs, disk interface. More work then I could do in a year & it'd only use about 1/2 the hardware area even if I had them all plugged in at once. Something like the added complexity of the circuit if I bump into problems with speed is enough to stop me in my tracks! I may take a look at putting them all on one page. JDR Microdevices is right down the street from me & I have to go there to pick up a 1.84 mHz crystal for the 6551 anyway. That is unless someone can tell me RS232 can take a 3% variation in speed so I can use the computers clock.

Isn't this what Chuck Steinman of Dataque was going to do, but with a 65816? This would be a really neat project, if we could get the circuit boards printed up. I have an extra 800xl with all the chips socketed, so it would be really easy to transplant the chips. While you are at it, might as well use a 65802 (65c02 pin-compatible).

I guess it was economically feasible for Dataque to produce their own next generation XE. (But I do see some sort of market for a <$150 home computer, with diskdrive.)

Has anybody thought of what could be done if you added a second GTIA? (I read that this is what the 7800 uses for graphics.)

What is the cost to have circuit boards made nowadays?

> ALSO I PRESS FOR EVERYONE OF YOU TO BUG THE heck OUT OF ATARI TO
> RELEASE THEIR DOCUMENTED SOURCE CODE FOR THE XL ROM's. ALL 500+ pages of it!

I don't understand why they haven't released a lot of things now that they don't support the 8-bits anymore. Interesting note though, in the latest Atari Explorer Online, they said they sold the remaining 8-bits, 2600, and 7800 overseas and in South America.

Later.....

Yeah, Dataque has the proposed 1600XLE or whatever. It sounded okay,
it promised lots of new features, but apparantly noone was interested.

I'd rather build something on the Parallel bus, like a 8mHz 65816
processor with 68881 math co. It would act as a parallel processor,
and could also run your floppy drives and SCSI devices and stuff.
At least that way you don't have to junk your existing 8 bit,
you still use it. If it breaks, unplug it and plug in a new one.

Jeff McWilliams

Rick,

Well, I can't really argue with your point about simplicity. But
if you wire in all that circuitry, and your computer goes bad, then what?
Also, I'm thinking more along the lines of something that people other than
800XL owners could do, which means Parallel Bus. That at least opens up
the upgrade to 130Xe and 600XL and 1200XL and 1400/1450 owners.
That's just my preference mind you, in the end I will probably throw
a 2nd PIA in my 800XL to get a fast printer port. I think it's healthy
to discuss different philosophies about upgrading the 8 bit hardware.
It keeps ME thinking anyway.

Jeff

1) what "back doors" and "cheats"?! (sure, I'm an addict, but I don't play THAT much!!)

and 2) Gyruss I suppose was made for the XL/XE series, or ported from 5200, because I saw it once on AtariBase, but by the time I got disk space to download it, it and other pirated stuff was gone (thanks to my bitching...and possibly others.. ;)). I don't mind... I'd rather not have it if it's pirated.

3734. Re: Falcon / binary postings to c.s.a.8

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 13:22:15 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9209151122.AA14430@brachot.jct.ac.il>
Source record: 109536

```
:) You're missing the point. If you post binaries to the discussion group,
:) regardless of subject, they end up in the digest, and force digest
:) readers to either slog through lots of crud they don't want to see, or
:) cancel their subscriptions.

Well, my suggestion makes the file appear in the END of the digest, letting
Digest readers to just abort the read, with the knowledge that there is
nothing after it... the Digest is sorted alphabetically, which is why I
suggest "zzzz name".

-Itay

3735. Re: Terminal Emulation

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 13:57:36 UTC
From: phile@pwcs.stpaul.gov
Message-ID: <9209151357.AA04965@pwcs.StPaul.GOV>
Source record: 109538

I asked for help on this newsgroup with modeming to my Unix account from home with my Atari 800. I am quite computer-illiterate, (my access to the account via Macintosh and telnet requires no Unix knowledge.)

```
_______ _____
| | | /\ |\ | | / / \
| | | / \ | \ | | / |
| |_____| / \ | \ | |__/ \_____
| | | /______\ | \ | | \ \
| | | | | \ | | \ |
| | | | | \ | | \ | |
| | | | | \| | \ \_____/
```

to lots of folks who helped me via Email, including:
Jim Johnson, Itay Chamiel, Bill Marcum, Nicholas J. DiMasi, Bob Hardy, Null Cypher, Chris Chiesa, Rob Funk, and Jeff McWilliams

Jeff Potter was able to supply an old termcap apparently written and posted by Howard S. Nichols. My Sysop was able to change it into a terminfo that gets me by for now.

The consensus is that I really need to use a program like Bobterm, VT10SQ, Kermit65 or Omnicom.

(The author of Bobterm was reportedly to speak at the SPACE meeting in the Twin Cities last Friday, but I was unable to attend.)

It looks like Kermit65 may be the best for me. There is no way I can ftp it to the Atari with my current setup. Is there any way I can get it on disk? I'd be happy to pay for the disk and the postage. Of course, I will need documentation understandable by an idiot...

Please reply via Email, as I seldom get to read newsgroups.

3736. GOOD ANSI FOR YOUR ATARI !!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 14:17:32 UTC
From: bb099@cleveland.Freenet.Edu
Message-ID: <194r9sINNkpt@usenet.INS.CWRU.Edu>
Source record: 109531

Even though I no longer own an Atari 8-bit (I traded it in a
swap for a Commodore clone of an XT). I remember a program I used
called ANSITerm. It gave all of the ANSI functions except for extra
large and highlighted text (it gives GOOD graphix). I now use ANSI
on my MS-DOS system and I can tell you that ANSITerm is great, about as
good as it can ever be.

I used it with a small, sharp B&W TV and once I got used to it
it was rather easy to use, just takes a wee bit of time and you are off to
the races.

Also there is a program I used called "VT100". It gave a good
VT100 emulation. Even though it did not have the graphics of ANSITerm
, the version I used (a special vers. for my SX-212 modem) a screen
dump to my 1025 printer was a handy feature. Also, the letters on VT100
where a bit easier to read.

Note: ANSITerm also has 40 col. ascii mode and an ATACII mode

NOTE:VT100 does NOT run on the 1200xl, but ANSITerm does

If you are interested, drop me some E-mail and I will
try to get it too you......

Ansit1.arc is now on Compuserv in the ATARI8 Sig. I am using it

right now. It is shareware . This program needs no, nada, zip,

hardware changes; but it does need at least 48k RAM.

It gives you a very readable 80 collum display

I would UUdecode it and send it to BART; but, one of my disk

drives is sick and I am only using one drive right now.

3739. Re: Adding a 2nd PIA

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 14:57:38 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <65907@cup.portal.com>
Source record: 109534

Ryan; I believe Wooley did a 2nd GTIA with it's own ram. He said it was so easy that Atari should have thought about doing it. I can't remember many of the details, but I think he did stuff like had one in displaying 16 lums while the other displayed 16 colors => 256 colors W/O DLI's. But I don't think many people jumped on the bandwagon so no drawing program or pictures were ever done on it. I think someone was going to GIF viewer, but I never heard if it got finished.
Jeff; I started out doing everything on the bus, but then from the surveys I've seen, only about 40% of us have 800XL's. It's no big thing, every signal on the bus can be had in the computer & every signal in the computer can be brought out to the buss. The only thing I'm sort'a worried about is if we start going to far from the original hardware design we will lose our ability to understand what each other is talking about. For instance, I think everyone in the sig can just say, "Yeah, another PIA at $D700, I know how to work that." without even seeing the schematic. Even something like a PIA @ $D320 wouldn't be a problem for most people that can read a joystick from hardware. As long as nobody designs something that goes out of the original hardware area or needs something like a one of a kind PROM, we're all right. I've got to admit though, I'm thinking a 34 pin expansion via a $3 disk drive cable would give me more then enough signals for anything I'd need, & 3 edge card connectors to boot!

3740. WANTED: Atari, Colecovision, Intellivision carts - buy/trade/sell

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 16:08:34 UTC
From: bs066@cleveland.Freenet.Edu
Message-ID: <1951q5INNcnq@usenet.INS.CWRU.Edu>
Source record: 109535
Cross-posted to: rec.games.video,comp.sys.atari.8bit,misc.forsale,misc.forsale.computers,misc.wanted

```
** Wanted: Used/new Atari 2600/5200/7800 games, Intellivision,Colecivision **
** and XEGS/Atari computer cartridge games. Will trade new/used/rare **
** games or buy games. **

Wanted: Atari 7800/5200/2600/8-bit computer, Intellivision, and Colecovision
video game cartridges. I would like to trade/buy/sell games. I have some
new and used games for those systems and would like to trade for games
that I do not have. I will also sell games (both new and used).

I will also pay a reasonable price for the games (depends on the game) and
pay shipping if you do not wish to trade. I will also buy games in sets
with the hardware if you are trying to get rid of an old system.

Please send me a list of the games that you would like to trade/sell and
what games you want in trade or the prices of the games you are selling.

Here is a list of the games that I have available for trade/sale for
2600/5200/7800, Intellivision, and Colecovision games. If you are interested
in trading, ask and I can send you an up-to-date (more or less) list of what
I have extras of. I also have a few rare titles for trade only.

New Atari 7800 games for trade/sale: (All by Atari)

------------------------------------
Ballblazer ($10) Tower Toppler ($20) Donkey Kong ($10)
Donkey Kong Jr. ($10) Joust ($10) Dark Chambers ($18)
Pole Position II ($6) Asteroids ($12) One-on-One Basketball ($10)
Robotron: 2084 ($10) Crossbow ($16) Touchdown Football ($18)
Xevious ($10) Choplifter ($18) Karateka ($18)
Dig-Dug ($8) Hat Trick ($12) Realsports Baseball ($18)
Jinks ($16) Galaga ($10) Impossible Mission ($28)
Food Fight ($10) Barnyard Blaster ($16) (light gun required)
Centipede ($12) Fight Night ($16) Ace of Aces ($24)

New Atari 2600 games for trade/sale: (All by Atari, except Starpath SC)

------------------------------------
---------> Starpath Super Charger with Games 1-4 <---------- ($30) ----------
Desert Falcon ($12) Gravitar ($24) Pole Position ($8) Venture ($10)
Sprint Master ($16) Super Football ($12) Jungle Hunt ($14) Centipede ($16)
Crossbow ($18) Crystal Castles ($12) Super Breakout($12)Battlezone ($14)
Jr. Pac-Man ($12) Solaris ($8) Kangaroo ($10) R.S. V-ball($12)
Secret Quest ($24) Space Invaders ($12) Asteroids ($14) Ms.Pac-Man ($18)
Vanguard ($20) Dark Chambers ($20)

New XEGS games for trade/sale: (All by Atari)

-----------------------------
```

Rescue on Fractalus ($24) Archon ($32) Ball Blazer($24)
Gato ($36) Barnyard Blaster ($36)

*** Note: Some of the new games may be out of stock and unavailable.
*** Some of the used games may have already been sold/traded.

Wondering why the prices are so high? -- Well, I spend quite a lot of time searching for these cartridges. My ultimate goal is to collect as many different cartridges for the above systems as possible. So, I greatly prefer to trade for games rather than sell them. When I sell them, I have to in some way justify all of the time I have put into finding that cartridge, that means I have to charge more $$$. If I trade for another cartridge(s) that I do not have, then I consider it even and I am happy.

Haggeling: Feel free. If you are buying multiple games, the chances are that I can give you a better deal than what is listed above. If you are just buying one. It's very unlikely.

Postage: Postage included when buying games and trading games (Except Intellivision games and all hardware).

Partial list if Atari 2600 USED games for trade (no manual/box):

Taz Tunnel Runner Steeplechase
Stellar Track Krull Basic Prog.
Dolphin Oink! Radar Lock (Many more....)

Partial list if Atari 5200 USED games for trade (no manual/box):

Miner 2049er Star Wars: The Arcade Game (Many more....)

Used Hardware for Trade/Sale (Shipping not included)

Systems:
Atari 2600, 2 Joysticks, 1 set of Paddles, Power Supply, Switch box, $25
Parts:
Atari 2600 (6 switch) Console only, $35
Atari 2600A (4 switch) Console only, $15
Atari 2600 power supply, $10
Atari 5200, 4 port model, Power Supply, Switchbox, $45 (No joysticks)
Atari 5200, 4 joystick port, console only, $10 (not sure if it works)
Atari 7800 Console only, $25

Used Super Nintendo games available for trade only

PilotWings R.P.M. Racing Super Ghouls and Ghosts

I am also interested in used video game hardware. Please also send a list of what you have and the prices.

Here is a PARTIAL list of the games that I am looking for. If you have any of these games for sale/trade, please write back and we can make a deal. But since this is just a partial list, if you are interested in trading at

all please write and I can send you the whole list.

Atari 2600 games wanted:

Roadrunner Atari# CX2663 Frog Pond Atari# CX2665
Swordquest Airworld Atari# CX2672 Dukes of Hazzard Atari# CX2678

Hey all you 8-bit freaks out there!

I am looking for an old..old ..old game
called Aztec Warrior an 8-bit game which i lost .....
I just wanted to know if anyone has it out there
or where can i find it....
I believe there was no cartrige for it ..
is it in the archives....
can anyone help!

Has anyone heard of it! It ws my favorite game of that type...
let me know..

Thanks,
Felix

3743. Fan Mail From a Flounder

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-15 18:06:05 UTC
From: thester@nyx.cs.du.edu
Message-ID: <1992Sep15.180605.19171@mnemosyne.cs.du.edu>
Source record: 109539

Excuse me for bringing this to the net, but I feel that this is
where it belongs. I have not done anything about posting binaries
other than take a vote to find out if it was at all possible for
us to create a separate group for that purpose. I don't pretend
to know everything about Internet and never will. Neither do
I pretend to know how everyone feels about binaries. I am just
a lowly user that likes to explore possibilities. Now I am
informed that it will be impossible to post binaries to this
group without coming off as a "fascist". Well excuse me folks,
but I thought we were trying to come up with a workable solution.
Had I known it would be a total waste of time and energy, I
never would have entered this fray in the first place.
Do not send me email about this subject. Period. If you wish
to berate me for attempting to bring some sort of consensus to
this newsgroup regarding binaries, do it here where it belongs.
That's the way us "fascists" do things.

The following is an abbreviated account via email between me
and an un-named dissenter. If he doesn't like me posting this
here then too bad. But then, again that's simply because
I am a "fascist" and that's the way we are. I don't have the
text of my replies to him in full here. That's because I
didn't think things were going to get this far and didn't save
them. If he wants to put 'em here he can.

REGARDING THE BINARIE VOTE

He says:

>Whichever way it turns out, please don't encourage folk to post binaries
>to the regular group.

To which I reply:

Now, I hardly think this is fair. The vote is at 46 for, 4 against.
We will definitely _not_ have a separate group for this.
I don't see your vote on my list, but that wouldn't change anything.
The upshot of it is, there will be few postings, and we will come up with
a protocol to best handle the annoyance to people that don't want them.
I can't think of one reason other than the subscribers to the digest
format of this group, that it shouldn't be done. Even in that case, there
has to be a way around it.
Sorry, but I _do_ plan to encourage it, and I myself plan to post binarie
uuencoded files. But not until the protocol is arrived at.
For a machine that is all but dead, (most won't admit this) any and all
sources available should be utilized.

His response:

It's a shame you feel that way. There are lots of ways to treat this
problem in an inclusive way, but you're apparently dead set on forging
ahead with a course that will alienate some of the readers. If you're
really interested in supporting an almost dead machine as much as
possible, I would think it would be a goal to keep eveybody on board as
long as possible. Apparently the real goal it to take your own favorite
way of doing something and shoving it down the throats of everyone who
disagrees.

Date: Tue, 15 Sep 1992 11:15 EDT
From: thester@nyx.cs.du.edu (Uncle Fester)

I said:

I would hardly call 46 votes for the binaries against 4 no votes "shoving
it down the throats of everyone who disagrees."
As I said (since you didn't seem to catch it), I plan to post binaries
when a protocol is reached. If you are a digest subscriber then I am
sorry that you feel as if your "reading" will be somehow ruined.

To which he replies:

I've been running the digest and the archives for 5 years. I *do* have
some experience of how this all works, and I've seen firsthand the
flurry of requests for unsubscription that arrive whenever somebody who
believes that netnews is the way of the whole world starts posting
binaries. We lost ~15 subscribers last time, and if you persist in
doing this, we'll eventually lose a lot of the rest.

** I have to add here that I was ignorant to the fact that he is **
** responsible for the digest form of this newsgroup. **

(he continues):

You're obviously intent on doing things your own way without considering
whether there's a way to do things that does a better job of serving
everyone's needs. So be it, I don't own the newsgroup any more than you
do. I'm merely suggesting that you can be a fascist and proclaim that
it's the right thing simply because a bunch of people say so, or you can
do things a different way. It's no skin off my nose, as I have other
means of reading the stuff that aren't impacted by binaries. It *does*
impact people who read the digests over slow lines.

... obstructive.

Uncle Fester

You're the expert. {HIS WORDS}

Yes! I'm EXPERT-MAN! Able to shove things down throats in a
single posting! Faster than a speeding binarie! Bend logic
in my bare hands! Fighting for the Fascist Way!

Pardon me, but the last time I checked, my 'things-to-do' file
didn't include forcing anything on anyone. If there is not
to be binaries postings, then I can live with that. What I
can't stand though is to be termed a 'fascist' for simply
exploring the idea that it might be nice to have the option
of posting binaries. Where was your email back when this
started, eh? While there is admittedly overwhelming support
for the idea of a separate group, there is no clear idea yet
as to how we could possibly do such a thing here. Is it
impossible for the reasons given by no-name above? Does
anyone know? Has anyone tried to find a way for a few
binaries to coexist with the least amount of disruption?
I haven't been in this group for 5 years, so how the heck
should I know? I thought that's what a forum was for; an
assembly for discussion of public affairs. This is the
forum for the Atari 8-bit computer. I don't run things here.
YOU PEOPLE DO. Post. Don't post. I don't care what you
decide. I am _not_ a fascist and never dreamed of aspiring (!?)
to that mentality.
I know that I am being harsh with this. I can't help that.
I'm sorry. I don't accept that something can't be done just
because so-and-so says it can't. I have seen only one
constructive suggestion regarding the conflict between the
digest subscribers and those that wish to post binaries.
That was from Itay Chamiel. And you know what? Nobody has
said anything about it! Why? Apparently because no-one gives
a damn, that's why!
I may come off as a screaming, fascist lunatic here, but at
least I give a damn about whether something should even be
worthy of scrutiny in the first place.

No apologies for anything I said.
Fascists don't apologize unless it's needed.

Uncle Fester

Rick,

Okay, I hear from where you are coming from. If we can get somebody
to help out with schematics for the other 8 bits, we can find out if
this easy PIA upgrade could be done in the other XL/XE machines as well.
Any takers?

Jeff

Hmm, well, in the words of Treebeard, let's not all get hasty!

Perhaps we should call for input from those who depend on the digest, to tell what they think of all this. I think there are those, like Dawn Scotting, who have to really watch how much mail comes their way, as they pay for it. I know that when I get really long digests, or AEO posts, I sometimes have serious problems getting rid of the darn thing.

Why is this so? Even if I tell my mailer to delete it, it has to twice as much space as my UNREAD mail file takes up. Often I've had to spend hours Kermitting files off of my account, just so there is room for the mailer to erase large digests and AEO issues. The Consultants are fairly helpless about my room shortage, and won't give me more breathing room in my account to alleviate the problem.

I am wondering, if the program that creates the digest has source code available, if it would be possible to omit C.S.A.8 posts that have a zzzz in the subject line. That way, the binary files would appear in c.s.a.8., but not in the Digest echo of it. I think the person responsible for creating the digests needs to respond to this idea. If it's not possible or feasible for one reason or another, that is fine. At least we explored the idea.

True, comp.sys.atari.8bit and the Digest aren't perfect, but for most of us, they are FREE, so let's not get too worked up about all this, and try to get along.

Message-ID: <1992Sep15.223825.26863@mnemosyne.cs.du.edu>
Source record: 109544

Jeff McWilliams had a good idea back there!
I had previously discussed this with Itay Chamiel about the program that creates the digest ignoring 'zzzz' in the subject line.
It should be relatively easy. Just as there are scripts for people that use the alt.binaries.pictures groups and other binaries groups to automagically cull subjects with 'gif' or 'jpg' in them, it should be just as easy to script for 'zzzz'.
Myself, I don't use one of those. (yet) I just use my 'n' key, but I do understand that those that get the digest don't have that option.
These are computers after all, for Pete's sake! What good is it if they can't address a problem that seems to be as simple as the one at hand?

What's (who) Treebeard? :-)

Remember, if you are going to mail a lot of books or magazines within the US, use USPS 4th Class Book Rate, it's really cheap. You can get 50 lbs across the country for around $15... Just be sure to package them fairly securely, because the Postal service treats them a lot rougher than 1st class mail...

Why not just do this?: Here is my blurb about a file:

blah blah blah blah...
blah blah.. that's all I got to say...

abort message now if you don't want it!!
<---snip--->

begin somefile.uue part 1/1
Table:
ABCDEFG

etc.etc.etc.... and if you don't want it.. skip it.

simple enough. When I read other groups, I always scan what I want to
read, but here, i read all messages no matter WHAT (unLESS they have to
do with...say...IBM->8-bit xfer or something extremely technical that I
don't need to know (yet)).

Is this sufficient?

Uncle Fester,

Well, the I think the idea would have to be implemented at the site
where the digest is composed, not by each individual receiver.
I know there are programming languages on this system, but how to write
a program to automatically exclude a binary from an incoming mail file
would be way beyond me. I don't have the time to research into such a thing.

Don't know who Treebeard is? OBVIOUSLY not a Tolkien fan! Hmmph!

What a nice thing to find on the internet - an Atari 8-bit newsgroup. It fills me with nostalgia. By coincidence, nostalgia is the reason I am writing an Atari Koala -> GIF 87a file converter on my PC clone.

I think I have it pretty much figured out, but does anybody know of a definitive and complete specification of the Atari 8-bit Koala file format?

What I don't have figured out at all (but am getting help with on Compuserve) is an Atari hue/luminance -> RGB colour map. Did Atari or anybody ever document such a thing? How would I go about generating such a map?

Any help would be appreciated,

Yes, that is what I meant. But if it is a Unix system, it should be very
easy for Mr. Dunning to create a script to sift the 'zzzz' files.
I'm not a programmer (I dabble), but if 5 years experience is worth
anything, (the Digest'er himself) it couldn't hurt to try it.
(Tryyyyy it! You'll liiiiiike it!) I know I would.

?W
Well, I kind of figured Treebeard must be something of a Fantasy nature.
Now I know. Thank you. And keep him around in case he's needed again.
Nothing like a little wisdom to keep things on track.

Source record: 109548

Well, Itay was gonna incorporate his fast 80 column handler into Omnicom.
But in searching for the sources, I finally got ahold of the author,
David Young. He said there was no way he could provide me with the sources.
He was totally vague as to why, but the feeling I got from the brief, terse
conversation was something on the order of he didn't have the sources,
or perhaps he no longer had any 8 bit period. I was totally bummed by the
conversation, it really ruined my evening.
SOMEBODY on the Internet has the sources, I remember the person mentioning
them sometime last year, but I can't for the life of me remember who it
was. Would the lucky party please raise their hand?

Jeff

This entire discussion about posting binaries is assinine. I'm a digest reader who totally depends on the digest for ia8 news. What binaries have come across I have had no interest in, but GET REAL PEOPLE! There is so little new software for the 8-bit you should be killing yourselves for every morsel, and cherish what files you are fortunate enough to pick up.

Above and beyond all of that, 45 to 5? This is the United States, right? The _convenience_ of the few does NOT outweigh the votes of the many!

Ignore the vote. Ignore the complaints. Post what you will.

>Is it because they figure it's cheaper to make it slow, and the ST user will
>just have no choice but to get it? I think THAT stinks.

Personally, I think it's quite possible that a 50MHz PC could get so bogged down trying to run Windows and OS/2 and whatnot, that it could conceivably end up running SLOWER than a more straightforward OS at 16MHz. The PC philosophy is clearly "why code efficiently when you can just throw a faster CPU in the box?" Yeah, but I want my faster CPU available for COMPUTING, not wasted driving the stupid SCREEN...

Anyway, it's still an open question as to whether ATARI is going to be the one to develop an EFFICIENT system that gets a realistic amount of power out of that 16MHz. What, Atari do something RIGHT for once? I sneer in the general direction of Tramiel-land...

Perhaps a UNIX guru-type could even teach the digestifier to search for what looks like a binary uuencoded file and delete it from the message, eliminating the need for "zzzz" or something in the subject. Is the digestifier even running on a UNIX system, JRD?

While we're at fixing the digestifier, it would certainly be nice if somebody could make mail sent to info-atar8@naucse.cse.nau.edu automatically be posted to c.s.a.8 like it's supposed to work. Sending to ucbvax.berkeley is admittedly less than 100% reliable.

Anyway, here's how I look at the binaries issue. Certainly we want to keep everyone happy as best we can, but we ought not to diminish our file-sharing ability at the expense of the whole group in order to do it.

Everyone fits into one of the following 3 categories:

1) If you can FTP you upload and download directly to atari.archive.umich.edu, no problem. (This group is made up of both c.s.a.8 and IA8 readers.)

2) If you can't do that, but you can e-mail, you send files to upload to weiner@atari.archive.umich.edu who puts them in the archive for you. You can download all files from the archive using the BART mailer. No problem. (This group contains the remainder of IA8 readers.)

3) You can only access c.s.a.8 (no FTP, no mail). If this is you, then the only way you can share files is to post to the discussion group. And, unfortunately, you have no way to get at the archive. (This group contains the remainder of c.s.a.8 readers.)

Assuming the situation does not change (i.e., we do not create a binaries group, we do not create a smarter digestifier, etc.), we must simply make the best compromise we can. Confining uploads to the archive makes them unavailable to those of group #3 above, but posting them to the discussion group can turn away IA8 subscribers. (Itay, even with the "zzzzz" idea to force binaries to the end of the digest, huge mail messages can wreak havoc on an account with a small disk quota.)

I submit it is less undesirable to not provide for file-sharing for those with only c.s.a.8 access(no FTP, no mail) than it is to turn away IA8 subscribers altogether. In addition, I believe that this group #3 is the smallest of the three. This is the compromise as long adopted by this group; this is the compromise described in my FAQ List for the group.

I applaud Uncle Fester's attempts to solve the file-sharing dilemma. As we search for a better solution, I hope all will keep in mind the various degrees of Net access represented by the readers of this group.

Couldn't one simply program a VBI or something that jabs itself in the way during a keypress to handle this? That would be pretty spiffy. For now, all the L1 and L2 lights do are go on and off when you [^F1] lock the keyboard and [^F4] go into Int'nat'l ch-set mode. hmmmmmmmmm

As to the 16mhz slow thing that itay was saying...

think about all the handy dandy coprocessors they have in it? I mean, compared to the IIGS, the Atari 8-bit is a lightspeed computer (at least looking at some of the software I've seen on the two). I saw some video game on the IIGS and since it had a bunch of enemies on the screen, all animated, it was going.....................................s....l...o..w! The 8-bit, on the other hand, would use some chset manipulation, or some other funky stuff (like Zybex & Draconus do for their animation) to speed the thing up... all handled by efficient programming and awesome graphics chips.

3765. 130XE keyboard reading problems

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-17 13:06:23 UTC
From: kcd@defender.ecn.purdue.edu
Message-ID: <kcd.716735183@defender.ecn.purdue.edu>
Source record: 109413

I'm looking for any help/advice/suggestions regarding the following problem:

My brother has two Atari 130XE's on which two columns of keys have stopped working. One column is the 2, W, S, and X and I don't remember exactly what the other column is, but its on the right hand side of the keyboard and includes some of the arrow keys. On one of machines the option keys (START, OPTION, etc.) across the top have also stopped working. I thought the problem was probably a broken trace on the keyboard so he opened one of them up and was able to detect keypresses on the mother board side of the keyboard to mother board contection so it seems that the keyboard traces are OK.

Anyone else have this problem and know what the fix is? Any ideas as to where he could send the machines to be fixed? Any and all help/advice will be greatly appreciated. --Kent

I could be wrong, but I'm pretty sure there is a problem with the
keyboard traces even if it's possible to detect keypresses.

Since you've got two computers and the fault isn't exactly the same
on both of them, try swapping keyboards to check if the problem
is in the keyboards or in the computers.

I tried to repair a 130XE keyboard with with damaged traces on
the thin plastic film once, but I failed.

It should be possible to buy a non-Atari keyboard with similar
layout, cut the existing pattern, and copy the 130XE's keyboard
matrix logic.

> to Ryan "Goz" Collins for his Z*Mag distribution list, or send it to me and
> I'll FTP it up to the archive and post it on the Cleveland Free-Net.

Michael,

Thank you for your comments. While I see what you are saying the reality of this is not so clear. As you are aware I am domiciled here in New Zealand, over 8,000 miles from New Jersey where Z*NET and Z*MAG is produced.

While I have no problem posting them to GEnie or Compuserve I do incurr large and I mean very LARGE email bills for the internet for both incoming and outgoing mail. As this site is funded from my own pocket I am unable to offer regular email to your archive.

This is a situation that does rile me a little. While I want to be able to do all this $900 to $1,000 email bills per month are a little over the top. There are users here on the net who do have access to GEnie and can download it direct to you Mike, and there are also users in this newsgroup who have full access to FNET where it is distrubuted to BBS's USA wide who could equally distribute it to you Mike.

On the other hand this is why I polled for posting it direct to the net as I do not pay for the email costs but people decided they did not want it. So we have created the alt.znet groups that carry most of the magazines and some limited fnet and fido traffic.

Mike I think what must happen here is the readers of this news group must sort there collective acts out and decide what they want to do not rely on others to do it for them. I would hope that some users in the USA would offer to be of assistance here for you Mike and the Atari section of the Free Net. (we live in hope).

Kind regards,

Dunno, haven't seen the Atari versions. Come to think of it, I'm not sure
if I've seen Zybex other than in magazine screenshots. Zybex was as far as
I remember some sideways scrolling shooter. Draconus was some running game
without scrolling, but shooting nasties.

Are we talking about the same games?

Oh, yuck. There are better ways than this to fix an XE keyboard. I also had similar problems with my 130XE and was able to trace (pun intended) the problem to two bad traces on the film. I was able to repair the damage with the liquid metal stuff, available at any auto parts store (at least in North America), to repair damaged rear window defrosters.

If that isn't feasible, I'm pretty sure that Best Electronics sells the plastic films as a separate item; their address is available from the vendor list which periodically gets posted here.

Hey! That's my other computer you're talking about!
Actually, the Apple IIgs is a pretty fast machine when you consider it
only runs at about 2.5MHz (or 1 MHz depending on the settings) and has
NO sprite handlers. Because of the more efficient 6500-based architecture
it can actually run circles around some comprable processes on a Mac.

>looking at some of the software I've seen on the two). I saw some video

I don't know what program this was, but I could show you some that run just
fine. Perhaps it was set on 1Mhz. (I grant you that arcade games may not
be it's strong suit, which is what I mainly use my 800 for.)

The only way I know how to fix traces is with either window defoger trace repair, or there is also a pc board trace repair soulution out there, but I've never come across it. (This can be a *very* difficult repair, at least with the defoger stuff).

> It should be possible to buy a non-Atari keyboard with similar

Anybody else done this? I was thinking of doing something similar, but from my little understanding of keyboards on the pc, it would entail building a circuit to decode the pc's keyboard output. Any other good keyboards out there to use?

> Hope this helps,
> Anders Skelander

Also, the owner of Xanth Corp. in Bellview, Washington told me that the XE keyboards have a 90% failure rate (at least this was for the single layered keyboard, don't remember if this also was the same for the two layered keyboard).

I agree with Mike Jewison, first try to repair the damaged traces with
some sort of liquid metal. If that doesn't work, try ordering just
the membrane from Best, and if that doesn`t work, next would be to
get a new keyboard. Or you could get the Transkey board, if Dataque
still sells them, and hook up an IBM keyboard. ;)

About Kermit-65 losing text when scrolling:

I haven't used K65, but OmniCom also can have trouble keeping up with
continuous output when the characters are coming in at >1200bps.
(The program does not have built-in speeds above 1200bps, but can be
run at higher speeds using the Custom setting, where you give hex
values for the XIO call(s) to set up the 850/etc. interface.)
OmniCom (OC) gets around this by sending a ^S to tell the host to stop
output, until OC can display the contents of its buffer, then it sends
a ^Q. Of course, this only works if the host supports this form of
flow control (which is very common but, so I have heard, not universal).
Also, I had a problem with one BBS which does not paginate (output a
screenful at a time), when I would use ^S and ^Q myself to pause and
resume output. OmniCom and I sort of got into a 'competition' and OC
would often send a ^Q (I guess) that would resume my ^S-pause. I got
around it by using the HELP key (equivalent of ^1 on an OmniView-equipped
8-bit) to pause and resume locallly, and OmniCom handled it fine.

3782. Easter Eggs in Atariwriter

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-19 02:47:11 UTC
From: chase@electron.rutgers.edu
Message-ID: <Sep.18.22.47.10.1992.5215@electron.rutgers.edu>
Source record: 109427

I was just reading through some old Analog magazines and came across an article about the history of AtariWriter Plus. Apparently the original AtariWriter had several easter eggs which could be accessed by shorting certain joystick pins together. There is, according to the article, a game and a couple of demos that exist inside the code. Has anyone seen these before?

Anyhow, Atari was understandably upset when they found out about these "features" Still, 80000 carts of AtariWriter were sold before they caught it. I wonder how to tell the versions apart.

Anyone else know of any unusual easter eggs. I know this subject gets covered every once in a while but I don't remember anything quite like this one. Most of the ones I've heard of are games within games. Still, with carts having a fixed memory, if you prog is 10K, that extra 6K looks tempting for a clever hack.

Trying to repair the traces is delicate work, and likely not to work
I tried using silver paint on a single spot on my traces once, but was unable
to improve the situation. In addition, while doing the work, I think I
caused another trace to break. I ordered a replacement sheet and was much
happier.

Okay, I didn't realize you had a prohibitively large bill to pay, even for sending mail. It can be tough for some of us to keep in mind the many levels of Internet access people have.

As you probably know, I've been long frustrated by the lag time between when an issue of Z*Mag is released and when someone takes the time and effort to get it out to the Internet. Note that #208 never did make it out to us, for example. Though we do have the latest, #210, thanks to Mike Todd.

Yes people, we have a Z*Mag Distribution List and we have Z*Mags at the atari.archive, but only when one of us that has access to it from another source takes the time to transfer it here. They don't appear on the Internet magically by themselves.

Sorry for the ranting, maybe it was something I ate...

I know of one for the orignal Atariwriter. It is possible to do a mail-merge. What you do is create a text file with the information you want merged into your letter, or whatever. You then create your letter, with the insert text command where you want information from the text file inserted. Then when you print the letter, and it asks you to enter the text, you hit <CNTRL>V, and then type the pathname of the text file. It will then add the information from the text file.

It works really well. I used this to make up 80 letters and envelopes for my girlfriend when she started job hunting. It was very easy! (Now I only need some sort of database program to create the addresses!)

Later.....

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <66239@cup.portal.com>
Source record: 109435

It's operation is almost identical to the other chips in the family
as far as putting it on the buss. Pin outs are
1 gnd 20 R/!W
2 CS0 27 phase2 clk
3 !CS1 26 !IRQ
4 !RES 25 DB&
5 RxC 24 DB6 (25=>DB7 opps)
6 XTAL1 23 DB5
7 XTAL2 22 DB4
8 !RTS 21 DB3
9 !CTS 20 DB2
10 TxD 19 DB1
11 !DTR 18 DB0
12 RxD 17 !DSR
13 RS0 16 !DCD
14 RS1 15 Vcc

Remember the PIA has RS0 tied to A1 7RS1 tied to A0 though. The only
thing you need to know about the crystal is to tie a 1.8432 MHz
crystal across it to get all the standard baud rates. You let one
pin float if you want to use an external clock for faster baud rates,
but who needs more the 19,200. <g> The registers are:
RS1 RS0 Write Read
0 0 transmit data recieve data
0 1 program reset status register
1 0 command register
1 1 control register
The control register's bit 7=># stop bits 0=1
bits 5 & 6 are word length 00=>8 bits, 01=>7 bits etc.
bit 4 is reciever clock source (?) 1=>BAUD rate generator 0=>clock
bits 0-3 =>BAUD rate with 1.8432 MHz crystal, one of 16, but
0110=300 1000=1200 1010=2400 1110=9600 1111=19200
The command register's bits 5-7 are for parity XX0=>no parity
bit 4=0=> normal, 1=>echo if bits 2&3=0
bits 3&2 are transmit interupt & !RTS
00 disabled & !RTS high
01 enabled & !RTS low
10 disabled & !RTS=low
bit 1 is to enable/disable !IRQ 0=>enabled
bit 0 is for the !DTR 0=>!DTR high
The status register bits 0-2 are just for errors in parity etc.
bit 3=>recieve register full
bit 4=>transmit data empty a 1 in either case means it's ready to
be read or written to.

bits 5,6,7 are !DCD, !DSR, IRQ respectively.
So it looks like to wet it up for let's say 2400 baud 8N1 with no
checks on the status lines it's just poke a 00011010 into the control
register, 00000101 into the command register then read or write
(make that read) the status register until something is rady to
go. Read or write to the data register when appropriate.

I've heard several stories about "hidden" features in the AtariWriter cart. About the only one that I KNOW is true is its mail merge feature. This is not a feature originally documented by Atari. AtariWriter can't create its own database as can AtariWriter+, but several database applications could be used with the AW cart to perform mailmerge functions.

Someone stated that "the owner of Xanth computers" (a computer dealer?) told them that XE keyboards have a "90% failure rate." IMHO, taken by itself, that number doesn't mean anything. I could state that _all_ keyboards have a 100% failure rate, which would be a true statement: If you use a keyboard (or just about anything) long enough, it will eventually fail. I'm not an expert at this kind of analysis, but in documents I have read that talked about hardware reliability, the concept of Mean Time Between Failure (MBTF) was used. No, I don't know any MBTF stats for _any_ Atari or other keyboards. I have seen _old_ ADM1/1A terminal keyboards (back in the late '70s) that were still working, and had been used so much that the edges of the keycaps were severely worn down (that was as much/more from _heavy_ use as _long_ use, but that's another variable).

If someone wants to say that "XE keyboards have a 90% failure rate," it ought to be qualified by a time span, like "90% of them fail within the first year of use," or something like that. Anecdotal evidence (:-]): my 130XE has been used for over five years by two people, with no keyboard problems. (Watch it fail tomorrow, now that I've said that :-)

>Are we talking about the same games?

I've seen the original packages for the XL/XE, there are screenshots
from the Atari XL/XE, C64/128, and Sinclair/Timex ZX Spectrum
computers on the cover and the games are almost identical with the usual
exceptions: Larger number of simultaneous colours on the C64, better
resolution on the Sinclair, better colour shading on the Atari.

Zeppelin Games released them in the late 80s or maybe in 1990. Btw I
read in Atari User that they were planning a release of Shadow of the
Beast for the XL/XE.

Well, I did replace my dad's crappy TV/video remote control
"keyboard" once. Lots of work, but it was definitely worth it, now
he's got a sturdy but still convenient control device that'll
survive a fall off the table in their living room.

I started doing the same with my damaged XE computer, but I
couldn't find a good keyboard in my huge pile of broken
computer/video game stuff.

It requires some boring work, and I have to add that I wouldn't
try anything like this if there were replacement parts available,
but for the remote control there weren't, and there weren't
any for the XE either. Perhaps the situation is better in the
US.

There's (almost) nothing I wouldn't do to keep my 8-bit alive.

Someone asked me about this, so earlier this year I dumped my AtariWriter
cartridge and pored over the assembly code with CodeBuster. Apparently mine
was a fixed version. I did see some references to the joystick ports, and
the code should cause the colors to perform a rainbow effect. But the code
I discovered is apparently "cut off" from the main stuff (you never JMP or
JSR to that part of the ROM). I tried doing what the code wanted, and
nothing happens.

Hi,
I have a long manual for those who are interested in technical stuff
for the 8bit. It's from the Cleveland Freenet, so I can post here OR
send to anyone who asks me.. I won't post it here since it's already
at the Freenet.. but if anybody wants it, mail me.. This offer will
last for around a week, and then I delete it, as it eats alot of
space, and I'm on what's more like a guest account..

It's the Atari Techincal Reference Manual by Bob Duhamel, from 1987..
Anyone interested please mail to any of the addresses below.

I just got this idea..
Since we can't get a binaries group, why don't we make a binary- mailing list? Just like the digest, only each file to be posted gets mailed someplace, and it automagically gets mailed to all recipients..

Who'd like to be in charge of handling such a thing?

-Itay

Here is a little discussion between me and John Dunning:

John:
after all, if the discussion group has enough readers to justify
remaining in existence, we ought to be able to get a binary group
created along side it. Even if that fails, there are other options.

Me:
It did, as we don't have the required 100 votes.. we barely have 50.

John:
So the next step, if I were doing it, would be to ask the guys that can
create newsgroups for an exception. It isn't the case here that you've
got a large number of people for it and a large number against it, but
rather than you've got a small but vociferous population on one
newsgroup, which wants to start another. If it is really the case that
there isn't enough interest to justify comp.sys.atari.8bit.binaries, why
is there enough interest to justify comp.sys.atari.8bit? That's not
rhetorical, it's a serious question. I would put it to the guys that
can create newsgroups.

End of the discussion.
The rest is up to whoever knows the guys who can make the newsgroups,
and can persuade them with the vote Uncle Fester managed..

I can't remember any instance in the past 6 years where the guidelines have been waived. If you really want to start a discussion about a potential petition, ask in news.groups. You'll be sure to be royally flamed. (Everyone who posts there is.) :-)

The answer to John's non-rhetorical question will probably be "then comp.sys.atari.8bit should be rmgrouped and relegated to a mailing list itself."

All processes associated with newsgroup creation are incredibly annoying, and almost invariably incite flame wars. (Welcome to Usenet, I suppose.)

3802. Quest for Refresh

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-21 21:56:09 UTC
From: jjmcwill@MTU.EDU
Message-ID: <9209212156.AA10075@mtu.edu>
Source record: 109448

From the Desk of Jeff McWilliams...
X-Mailer: ELM [version 2.3 PL11]

Newsgroups: comp.sys.atari.8bit
Subject: The quest for refresh
Summary: DRAM refreshing on the 65816
Sender: Jeff McWilliams (jjmcwill@mtu.edu)
Distribution: comp.sys.atari.8bit
Organization: Michigan Technological University

Lately I've been looking at the 65816 microprocessor, which is a 16 bit
version of the 6502 we all know and love. I've been thinking of purchasing
a 10mHz part and adding up to 6 megabytes of RAM to it, and having it
act as a slave processor for the Atari, doing everything from hardware
interfacing, graphics processing, floating point math, to program
multitasking. The biggest hang up is designing circuitry that will refresh
the DRAM memory. SRAM memory could be used to avoid the problem, but costs
on the order of 4 times as much per megabyte as DRAM does. I placed a call
to WDC today, the makers of the 65816. Their engineer was out for the day,
so I was told to try a firm that was familiar with the '816 and had
cooperatively worked with WDC in the past. I explained I was an engineering
student, researching the possibilities of using the '816 in a slave
processor type situation, and that I was having difficulty coming up with
some info on DRAM refreshing. There are commercial chips available from
several companies, including National Semiconductor, which handle DRAM
refresh for CPUs. The problem is such microprocessors, as the Intel 80x87
series, and the 68000 series from Motorola are asynchronous, whereas the
6502 and 65816 are synchronous processors. This is a term relating to
how the system clock relates to data transfer to/from the chip.
What the gentle man told me was not totally encouraging. What they did
when they looked at the 65816 when it first came out,... way back...
was to have the CPU do the refresh. An external hardware timer would
interrupt the CPU when the DRAM needed refreshing. The CPU would then
do a long series of reads to the DRAm, which essentially refreshes the
circuitry inside the DRAM. When it was all over, the CPU could continue
on its way. Well, I suppose it could be done that way. I was hoping
the refresh could be handled transparantly. He commented that at 8 or 10mHz,
you would need really fast RAM, and the timing would be horribly tight
to accomplish this. I hadn't thought of that, when I had read the specs for
DRAM refresh in my Motorola databook, I had been thinking in terms of the good
old 1.8mHz clock of the 6502.

need pricing for 65816 processors? The dynamic version runs $42.40 for
8mHz, in a 40pin DIP. the Static version at 10mHz runs $14.91. Is there
a misquote here? No, I asked Deb at WDC about it, and she said the price

difference was due to one chip being produced locally, while the other wasn't.
Go figure. How fast can a 65816 go? WDC has pulled the high quality
10mHz 65816s from their process, and tested some of them reliably at
14mHz, in a PLCC package. The cost of this chip is $95.00. I think that at
that price, I can settle for 10mHz for $14.91 instead.
even with the delay caused by manual refresh, 10mhz
still makes a zippy CPU! Oh, mimimum order is $100.00 from WDC, in case
you're gonna run out and order from them. I am gonna talk to the WDC
engineer tomorrow to see if they have anything further on this, and beg
for some application notes regarding this refresh as well. I still
don't know how to wire up CAS and RAS! Time to crack the databooks again...

Anybody got data on SIMM modules?

I have an atari 400 with 48K for sale, it includes
9 game carts:

Jumpan Jr., Asteroids, Platter Mania, Fraction Fever,
Basketball, Night Strike, Krazy Shootout, Fun with Art,
and computer war.

$75/bo.

Ed

3804. Re: Mailing list instead of new group??

Newsgroup: comp.sys.atari.8bit

In a previous article, bruck@BRACHOT.JCT.AC.IL (Itay Chamie1) says:

>
>I just got this idea..
>Since we can't get a binaries group, why don't we make a binary- mailing
>list? Just like the digest, only each file to be posted gets mailed
>someplace, and it automagically gets mailed to all recipients..

That wouldn't solve anything. Those people that can receive mail lists
should be ablw to receive files from BART already.

And those people that have no access to the Archive through BART would have
no access to such a binaries mail list either.

We seem to have decided we don't have the numbers for a regular binaries
group, but is there anything preventing us from an alt.binaries type group?
I understand that alt. groups are easier to create; the disadvantage would
be that many Usenet sites don't carry the alt.* hierarchy.

In article <66354@cup.portal.com> Rick_Michael_Cortese@cup.portal.com writes:
>Just an odd question, is there anyway we could tag along with the ST groups?

I like this one! There is already an ST binaries group, and the traffic level is quite low. Why not have all Ataris share one binary group? A convention for prefacing subject lines would aid in sorting out whose is which. What would it take to make this idea happen?

I thought this idea was rather brilliant also. I e-mailed Rick asking if
he wanted to look into what it would take; I offered to try to find out
myself if he didn't want to. If anyone else wants to take a shot at learning
the ropes of comp.binaries.atari.st and seeing if they'll let us use the
group also, go for it! Post here first so we don't all bother them at
once. (I'm too busy at the moment.)

To add your user group to this listing, please send the following information to the online service addresses listed at the top of this list, via E-Mail to LAWRENCE ESTEP on The Atari Scene! BBS at (502) 456-4292, or call our 24 hour voice mailbox and leave your update info at (812) 948-6278. Your information will be added to the listing when the next update is made.

Information needed:

Group name/address

Name and phone number of contact person(s)
Online service id(s) (if applicable) of contact person(s)

Meeting time(s)/location(s)

Support provided for which computers (8-bit, ST, etc.)

Additional information if available
(Bulletin Board System number, newsletter information, yearly dues, etc.).

Atari Classics is not responsible for errors or omissions to this listing.
We will make every effort to correct this list in a timely manner if updates
are provided via the methods mentioned above.

On behalf of the entire Atari community, I thank you for helping to keep this
list as accuarate as possible.

-Lawrence Estep
Atari Classics Telecommunications Editor

>not dawdle around -- as the man said: There just isnt that much 8 bit
>stuff floating around out there anymore. Lets distribute what is
>left..
>/
>Binaries!!

Well, what I say is SEND THE BINARIES IN THIS VERY GROUP.

WE SHOULD UUENCODE THEM AND THEN SEND THE UUENCODED FILES.
(UNIX- or Atari- uuencoded?)

Anyway, I voted NO on the separate group for binaries - I think (and
that is what I said) that one group is enough (we are few persons in
here and traffic is not going to get unacceptably huge).

I got a little piece of info to correct the FAQ:

a friend of mine bought in 1986 an ATARI XM301 modem --- it is 300 baud
and has a terminal program: "XE TERM".
It also comes with a VERY long text file (296 (DOS 2.5) sectors) which
is a tech manual.

3817. Rana 1000 getting wild!! AArrgghh!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-23 18:40:06 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9209231640.AA20768@brachot.jct.ac.il>
Source record: 109359

My Rana 1000 disk drive is dying.. I'll soon be totally out from my Atari,
so help please!!
Fixed problems:
A) The power switch flied out of place. I now cover the what's
left of the pins with a piece of metal..

B) The write protect sensor flied out as well, so I shorted it
so I'll be able to write on the disks (I was out for a long
time before I thot of doing it!! Imagine, not being able to
save anything... AAArrrrggghhh!)
and now only the "protect" switch in the front of the drive
works to change it.

And now C), which is my current, horrifying problem:

The drive motor (NOT the stepper motor) makes funny noises when it turns,
as if something which is turning is hitting something inside. The noise
is a very fast click - maybe 10 clicks per second. Worse, none of my
disks will read unless I press down on the center of the motor. The black
dot. I can't feel anything change when I do it, but it A) makes it quiet
B) Makes it faster (you can hear, the sectors come in faster) and C) the
drive becomes alot more error-proof.
When I let go, the noise comes back, and the errors return.
Yes, I did clean the heads.

btw, Rana 1000 came in 2 flavors, one with the turn-open door (like the
Indus GT) and one with a push in-up door, which is what I have (I hate
it.)...

Anyone knows what I can do??

-Itay

3818. 1050 for sale

Newsgroup: comp.sys.atari.8bit

Source record: 109363

BEGIN FORWARDED MESSAGE FROM STEVE GRIMM (koreth@spud.hyperion.com)

I would rather not use comp.binaries.atari.st for binaries that don't run
on the Atari ST. The best approach is probably to create a new newsgroup
comp.binaries.atari.8bit (and probably comp.sources.atari.8bit as well.)
Presumably the folks at atari.archive would be willing to pick up whatever
went across the group. I'm not sure what they do about comp.*.atari.st
at the moment.

Feel free to pass that on to the newsgroup (my site doesn't get it, though
I suppose we probably should.)

END FORWARDED MESSAGE

I will write to Steve again in e-mail explaining that we don't believe we have
the numbers to create a comp.binaries.atari.8bit...

(I will also point out he could post to c.s.a.8/IA8 through ucbvax.berkeley)

I suppose that we could also use something like misc.misc and post a notice to this group when we put something there. Or if you really want to get flammed, you could try taking over some other group. There must be some group out there that isn't really being used. :-)

Actually, I'm still confused as to the need--it seems so weird to have access to UseNet newsgroups but not have some sort of E-mail or FTP access, both of which are sufficient for use of the archive (though I admit using E-mail may be awkward).

Oh well.

There should be no difference between the two, other than the end-of-line characters, which would have to be converted, and Atari term programs do that automatically. Is there a difference between Atari and Unix uuencoding? If so, we should write a new Atari program that conforms to the Unix standard. Those of us on Unix systems can uudecode or encode a file on-line in seconds.

Are you talking about Aztec challenge or Aztec? I think your talking about Aztec. Ive got that game. Its where you walk around and pick up stuff, check boxes, and if you go down anuf levels you look for the idol. yep, that is a neat game. I especialy like the hi-resolution grafix(obviously ported from the apple 2 version.) and animation.
Maybe I can get it to you but I dont know how to send binary files. I know your supposed to have some BASIC program to make them ASCII but how do you get it? Why cant someone just list the program as a message?

3824. Re: Using comp.binaries.atari.st

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-24 02:27:20 UTC
From: koreth@spud.Hyperion.COM
Message-ID: <19r928INNr0u@spud.Hyperion.COM>
Source record: 109371

Okay, I'm here now. My site wasn't getting comp.sys.atari.8bit until I requested it this morning.

Here are a few reasons I think using comp.binaries.atari.st for 8-bit binaries is a bad idea.

1. CBAS has a few thousand readers. As indicated by the recent poll here, only a small fraction of them would be interested in 8-bit binaries; many of the rest would just be annoyed by them. I have to consider what the readers want, and my intuition is that a majority of them would be against including 8-bit stuff in CBAS. (But see below.)

2. Some sites archive CBAS, and if both architectures' binaries were in the same group, these sites would hold a mishmash of programs, with no easy way to tell (short of transferring them to a local host) which ones were for which systems. One could alleviate this to some extent with good index files, but that won't help the people who ftp to an archive, browse around, and grab something that looks interesting. They would generate untold numbers of "I got this program from the archives, but I can't get it to work" messages on both discussion groups.

3. I'm not really set up to test out 8-bit software before posting it to the group. This could be solved with a co-moderator, a solution which causes some problems of its own.

Those are the top three reasons in my mind. Now, if someone takes a poll on comp.sys.atari.st, and the majority of the responses are positive, I'll carry 8-bit software despite all this. But for 40 or 50 people, a mailing list (or a moderated alt group) seems far more appropriate to me.

-Steve

Note that a mailing list does not address our problem, being that those people that access c.s.a.8bit but cannot FTP nor e-mail (the people that are excluded from file-sharing in our present compromised situation) would not have access to such a mailing list either.

Unless others here can put up a good argument for Steve that he should allow us to use c.b.a.st (it doesn't look to me like we can), I still see two possibilities to explore:

1) As Steve suggests, a moderated alt group. The main problem with this that I can see is that not all Usenet sites carry alt groups.

2) Using a universally neutral group such as misc.misc.

What are people's preferences?

I think there were a few articles in Antic, ANALOG, & Compute. I think one had a way to use the cart for file transfer over modems, another listed the different printer device numbers so you do something like have a 1020 & Centronics printer hooked up to an 850 on line at the same time, then just direct the print to P5: P2: etc. There's a +200K file on the system I use that has cheats & secret codes for different games. Most of the ones listed are for newer games.

3834. Don't used atari.st for binaries!!

>(I will also point out he could post to c.s.a.8/IA8 through ucbvax.berkeley)

I don't think that using comp.binaries.atari.st is a good idea. That group
by definition is for the ST. The ST people will get pissed that there is
8-bit stuff in there (I would if I had an ST) and 8-bit people that miss
this discussion will not know to go there. We should either have a
binary group with the name atari.8-bit or not, but using someone else's
groups is just not a good idea.

I'm the one that origionally asked about starting an 8-bit binaries group,
and if it ends up in the ST binaries area, I doubt I will use it.

>WE SHOULD UUENCODE THEM AND THEN SEND THE UUENCODED FILES.
>(UNIX- or Atari- uuencoded?)

I'm not aware of any hardware-specific aspect to uuencoding. I download 8-bit Atari software from the archive using BART to get it to my Tandem mainframe, use an MS-DOS machine to transfer it to a 3.5-inch floppy, uudecode it on my ST, and then move it to the 8-bit. I have also used the somewhat-more-finicky uudecode routine on my Unix system, and that works as well. It just requires a bit more preparation of the file.

>Anyway, I voted NO on the separate group for binaries - I think (and
>that is what I said) that one group is enough (we are few persons in
>here and traffic is not going to get unacceptably huge).

Traffic here isn't the only issue. People who receive this in digest form because they have no access to usenet have a problem with the large uuencoded files in the middle of their digests.

}I got a little piece of info to correct the FAQ:
}
}a friend of mine bought in 1986 an ATARI XM301 modem --- it is 300 baud
}and has a terminal program: "XE TERM".
} It also comes with a VERY long text file (296 (DOS 2.5) sectors) which
}is a tech manual.

I have exactly the same thing, purchased about the same time, so that was apparently the standard package. I used XE Term for about two weeks before someone told me about the 1030 Express! comm program; the XM301 got used about two years before I could afford a third-hand 1200-baud modem. Now it all sits in its package, waiting for a museum to call.

This might be flamebait, but how about retaking a vote on
comp.sys.atari.8bit.binary ?
I didn't vote the last time 'coz I was on vacation. It occurs to me that a
few dozen more people were gone too. Since the semester at least in Germany
starts in oktober, the other countries should be well in their semesters
by then already, we have a better chance of making the "comp" mark, when
taking the vote at a time most people are sure to be on the net.

Else I'd be in favor of an alt group.

Nat!

3838. Bootstrapping net access?

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-24 19:04:18 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Sep24.190418.14245@a.cs.okstate.edu>
Source record: 109386

I have an 8bit and rudimentary (incompatable protocol) terminal software.
Is there a "text" file containing uudecode that I can "enter" into atari
BASIC?

So that I can uudecode "ARC" or LZH" or whatever...

So that I can unpack new terminal software.... and get rolling?
No xmodem on the mainframe... no decompreddion utilities on the 8bit...

Any ideas?
jc

Open up the P:R: connection and you will find some little jumper
blocks. One of these selects whether the interface sends just
Linefeeds, or Carriage Returns and Linefeeds.

One thing I want to do with my homebrew interface is code the driver
so that I can have it do heavy, light, or no translation.

Meaning the following:

Heavy: 155 converted to CR and LF
Light: 155 converted to CR
None: no conversion, file must have ASCII CRs and LFs in it.

This way, the old problem of watching out for 155s in a binary
screen dump won't occur.

>Andrew
>_____
Andrew,

I think you are referring to the fact that If you have SD-X format 80
tracks in high speed mode, the last 40 tracks get formatted in
slow mode instead. Those silly ICD people!

Boot up a version of 3.2d SpartaDOS that has been modified for the
XF551, and format the disk with XINIT, and tell it not to use the
high speed sector skew when it asks. The disk will be formatted in
XF551 high speed mode, all 80 tracks.

> only way you can share files is to post to the discussion group. And,
> unfortunately, you have no way to get at the archive. (This group contains
> the remainder of c.s.a.8 readers.)

This has GOT to be a pretty small group. It would seem to me that the best solution would be to set up a mailing list for just binaries. Ideally, it would be moderated by someone with the time and enough disk space to hold the binaries. He could then release them at a study flow rate so some small sites wouldn't be overwhelmed. A short note could be posted in c.s.a.8 and the digest that such & such a program was mailed out. To make it a little easier on the moderator, there would be no 'special orders'. You would either be on the mailing list or off. Since this would be separate from the digest, they wouldn't have cause to complain. There are TONS of great little programs available. We could have 'theme' months, i.e. music, where only music players and .AMP, .AMS, etc files are mailed out. The possibilities are endless.

3843. Re: Using comp.binaries.atari.st

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-24 21:31:20 UTC
From: dunham@mpd.tandem.com
Message-ID: <2519@devnull.mpd.tandem.com>
Source record: 109388

In article <19sjv2INNf9s@usenet.INS.CWRU.Edu} aa700@cleveland.Freenet.Edu (Michael Current) writes:

}In a previous article, koreth@spud.Hyperion.COM (Steven Grimm) says:

}>Those are the top three reasons in my mind. Now, if someone takes a
}>poll on comp.sys.atari.st, and the majority of the responses are positive,
}>I'll carry 8-bit software despite all this. But for 40 or 50 people, a
}>mailing list (or a moderated alt group) seems far more appropriate to me.

}Note that a mailing list does not address our problem, being that those
}people that access c.s.a.8bit but cannot FTP nor e-mail (the people that
}are excluded from file-sharing in our present compromised situation) would
}not have access to such a mailing list either.
}
}Unless others here can put up a good argument for Steve that he should
}allow us to use c.b.a.st (it doesn't look to me like we can), I still see
}two possibilities to explore:
}
}1) As Steve suggests, a moderated alt group. The main problem with this
}that I can see is that not all Usenet sites carry alt groups.
}
}2) Using a universally neutral group such as misc.misc.
}
}What are people's preferences?

I think we're giving up on sharing the ST binaries newsgroup too easily. It is really by far the best for the most people. I don't think Steve realizes how low the traffic would be in what is already a very low traffic group. Has someone presented to him just what the problems are with all the other solutions and indicated just how small the impact to the ST binaries group would be? Some excellent objections to the other solutions have been raised, and I'd collate them and make the case, but I've kept nothing.

Considering the problem all Atarians have with support, I would think it would be in the best interest of all Atarians if we made an effort to co-operate and pull together.

I guess I should admit here that I have a possibly biased view, since I am both an 8-bit and ST user.

400, 600XL, 800XL, 520ST, 1040STf (never mind the Sinclairs....)

>I just got an account at work which allows FTP access. Unfortunately, the site
>is long distance from my home and my atari, and the machine at work is a MAC.
>Anyone have any suggestions on getting 8bit files from the MAC to my Atari with
>incurring Large LD charges?
(1) Bring the Atari to work and use a null modem cable
(2) Get PC Pursuit (if your workplace is in a Pursuitable city)
(3) Get an account on Compuserve, Genie or other commercial network and mail
the files to yourself
(4) Is the Atari the only computer you have at home? If you have a clone or
an ST, use the Mac to copy the files to an IBM-format disk, then use
your other computer to transfer them to the Atari.

Just a few ideas off the top of my head. Far as I know, nobody's written a
program like ATARIO for the Mac. Maybe, if it's a Mac that has MSDOS
emulation, and a 5.25 floppy drive...

You might try posting in comp.sys.apple2, they are very
knowledgable in the 65816 category. (They'll either be very helpful or
they'll flame you. :-)

> Anybody got data on SIMM modules?

I have the pinouts somewhere for SIMMs, but that's about all I
have.

On another note, have you looked into the 65802? It is pin
compatible with the 6502, but has 16 bit registers. It unfortunately has
only 64k address space though. I know the Apple][people have been
replacing their 6502s with this and have no problems. I've been thinking
about doing it to my 400, but haven't got around to it yet. The XL/XE
series would probably require some daughterboard because of the 6502C.

It wouldn't give you that much of a speed increase, but it would
give you some more instructions and 16bit registers. (maybe if you gave
it some sort of cache and ran it faster, like the 16MHz accelerators for
the ST. I don't know how much of a speed increase this would give
you because of how tightly the CPU is coupled with ANTIC.)

I'm writing an envelope program in Turbo Basic, and it prints sideways so it is easier to load envelope. So, I'm doing everything in graphics mode, and it is slower then molassess. Right now I "OPEN" the printer, and then use PRINT #1; to output to the printer. Even compiled and with the screen off it is still too slow. Does anyone have a faster method?

I'm using the built in character set for the font, so does anyone else have some standard atari fonts they could send me? I want to be able to use multiple fonts. (Which will be trivial to add.)

Thanks!!!!!

>
> As you probably know, I've been long frustrated by the lag time between
> when an issue of Z*Mag is released and when someone takes the time and
> effort to get it out to the Internet. Note that #208 never did make it out
> to us, for example. Though we do have the latest, #210, thanks to Mike
> Todd.

I email out the zmagazines to several people internal to Bell Labs and
to a few outside. I have volunteered before and I will do so again. I
usually rely on Ryan to email me a copy but if it takes him a while to
get a copy to me, I call Ron's BBS and download it myself. Note that
the operative word is 'aware'. Since the 8bit Zmag is so irregular, I'm
never sure when it is available unless someone mentions it.

RE: Zmag #208. I didn't email it out unless those on my mailing list
ask for it because it wasn't a normal zmag. It was just a collection
of files arced together. Most of them were LYNX game reviews. If you
want a copy, I'll send it.

Source record: 109398

The problem with, and distinction among, the various (Unix/MS-DOS/Atari/other)
implementations of UUencode/decode, as with any "de-facto standard" that peopl
pick up on and run with, is that not all versions were implemented correctly
or by programmers who understood what it was they were trying to do! I for
one have seen different implementations of UUencode for the same system (VMS)
which produced DIFFERENT UUencoded output when run against the SAME input
file. And I have a version on my Amiga which appends a "line checksum" byte
at the end of every line, but which seems happy to work quite nicely with
all other systems' versions of UUdecode. Go figure.
Anyway, yeah, there can be differences, but usually they're pretty minor.

Chris Chiesa

Source record: 109402

Just double checking, you do have a modified XF right? The stock one only does 40 track DS. 4.19, which is what I have, will not do 80 tracks high speed with the Wooley modified drive, 4.20 will from what I've heard.

3860. Re: 1200XL Help!!!!

Newsgroup: comp.sys.atari.8bit

The 1200XL was made after the 400/800 series & before the 800XL. They have 64k of ram & run most carts & disk based software. 15 graphic modes are available including a 320x192 graphics, 40 column text, etc. If you didn't get a power supply, it's just a 9VAC rated at 31VA. This was the last Atari W/O built in basic so you need a basic cart if you didn't get one.

Yes, I am very familiar with all the 65xx chips, just got another
set of specs, for the 65802, 65816, 65816S, 65C22S and some other
stuff from WDC. I talked to Applied Engineering and Zip Technologies
the two companies who make the accelerator cards for the Apple II and
IIgs. ZIP technologies spent 30,000 bucks in R&D coming up with the
ASIC for their accelerator card. They said there's no way they would
consider doing it for another machine, it's a lot of hairy stuff.
The thing is when you run a high speed CPU, you have to use data and
program cache using high speed (expensive!) static RAM. You also
need to slow down the processor to the regular BUS speed when you
access DRAM memory, or anything in the Atari hardware.

Bob Puff said that because of the Antic GTIA, being as you said,
closely linked with the cpu, it wouldn't be practical to accelerate
the Atari. The board would end up costing at least $300.00, and unless
there's a ton of people willing to pay that, nobody is gonna make it.
Too bad though, WDC just put out a 14mHz chip, which the Apple IIgs
folks are putting in some of their accelerator cards.

It kinda makes me green with envy.

It would be nice to at least have something to support the 65816 card
that Dataque sells. There's no programming language for it, or anything.
Am I the only one left on the face of this earth who's interested
in running a 16 bit CPU in my 8 bit? Am I really all alone?

Jeff McWilliams

excuse this interruption, however i was informed that there would
possibly be some interest in these groups for some of the equipment,
most notably the pdp systems. forgive me if i was mis-informed.

-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-< * >-=-=-=-=-=-=-=-=-=-=-=-=-=-=-

for sale:

computer systems:

1) atari 800XL $ 250.00
1050 diskdrive
1030 modem
tons of software
tons of documentation
atari 2600 game
all the cartridges

2) commodore 128/64 $200.00
1571 diskdrive
tons of software
tons of documentation

3) H.P. 150 touchscreen $250.00
built in terminal
640K ram (expandable to 1Meg)
2 - 3.5" floppy drives
P.A.M. operating system
ms dos 2.1 for H.P. touchscreens
applications and software

4) 2 each digital pdp 11/34 computers $500.00 for 1
700.00 for both.
(if you buy both for $1,200.00, all of the perriferals are included,
including disks, tapes, terminals, printers, diskdrives, boards,
cables, powersupplies and racks) *

5) 1 each digital pdp 11/23 computer $700.00
(with 2 harddrives, in 1/2 size rack - plug and load)
(for $500.00, all perriferals will be included as outlined
above) *

6) 6 harddrives, (could be used with either of the pdp configurations)
(including 2 - c3d 660Meg removable media harddrives)
4 + tapedrives
tons of disks

tons of tapes
tons of documentation
tons of extra boards
decwriter III
decprinter II
terminals (various states)
modems (at least three)
extra boards
other equipment....
all cables available

(i will break up some stuff, but not the atari, commodore or pdp 11/23
systems. i will add to them in any configuration that is reasonable)

i *MUST* get this stuff *OUT* of my garage, *immediately*!
i am amenable to trades, but have very specific needs. all items
can be shipped except the large systems. shipping in NOT included
in the price, and (due to the fact that i have been burned twice, now)
payment is certified before delivery. delivery is the responsibility of
the purchaser.

if you are interested, you may contact me at the addressses in my sig.
please designate the subject as 're.: computers for sale', otherwise i
may not get bact to you as quickly. all items will go on a 1st come,
1st served basis, and purchasers of complete systems will be considered
over partial pieces.

and, as always, i am/at:

doug: < doug@eng.umd.edu > : < doug@lpf.umd.edu >

Well, there has to be some allowance for style, I doubt if any two people program alike, but...
If you think of the language as being able to define your own commands like those in Atari basic you'll be a little ahead of the game. Most of the commands (built in!) are equivalent to basic commmands, but if you think of it as an extendable language, your final code will be much easier to read. I usually start with the thing as an outline with the functions I want not implemented i.e.

```
PROC Intro()
RETURN
PROC Loadchar()
RETURN
PROC Changset()
RETURN
PROC Saveit()
RETURN
PROC Main()
intro()
Loadchar()
Changset()
Saveit()
RETURN
```

Then I develop my code for each of the right after where they are called in Main. All routines in Action! are considered subroutines except the LAST one, traditionally called main(). For instance, after Loadchar() in Main() I would start off with something like:

```
Poke(106, 128)
Graphics(0)
Open(1, "D:EXP.FNT", 4, 0)
for cnt=128*256 to 128*256+1023
do
x=GetD(1)
Poke(cnt,x)
od
Close(1)
```

Assume that there was a Card cnt and a Byte s declared globally somewhere & ingnore the fact you'd use pointers verses the Poke command. I don't think anyone but me is a regular Action! user & there's only a few hotdogs that would critisize you for "POOR FORM". Whoops! That's Byte X above. Anyway, once I have the routine debugged in Main(), I just use the editor to cut & paste it between the Loadchar() and RETURN. The Biggest mistake I made was trying to do things with only one function, Main(). you end up writting code that looks worse then basic! I just didn't know better. Things will

be confusing for about a month, & then it should dawn on you that this is the way to go ala "I see the light!" You'll start to see how it's really a pain to have to use 'A=INT(X)' in basic. The manual isn't the greatest & there's no begining Action! book like basic, but it's worth it. I'll see if I've got some old Action! code lying around somewhere. I know I've still got that 80 column terminal program that I never got around to writting faster screen scroll routines for <sigh>. It's not pretty, just fuctional. Maybe I'll U/L it here & if enough people complain about the speed I'll do something with it.

I've got nothing against a 16 bit version of the 6502, it's just that I don't see it as adding that much enjoyment to the type of computing I do now. For instance, I though it was really neat when Steve Cicara added a dozen or so 8031's to a clone to act as a math engine, but I didn't run out and buy one because I don't have a need for it. I could add a math co-processor to my clone for less then $80, but I won't do it because I don't run that many math intensive programs. A 65816 with a couple of static RAMs & one ROM would be interesting since it would cost less then $30, but things like 6 megs of DRAM would only be good for a ramdisk & I don't think I'd ever use one that big. James Hague is right, at least in this case, when he says "application". If you haven't taken them yet, I believe you may take alot of computer graphic programming classes requiring 3D imaging etc. If you had a GREAT application for the thingie, I'd get a little more excited. Personally, I'm a little dry. 20 years ago I new I needed computing power for what eventually became spreadsheets & word processors, now I'm a little lost as to what they can do that they aren't doing yet. But then you're the EE so you're suppose to figure that out right<g>! Even adding a plain vanilla 6502 would more then double the processing power of a 800 since it wouldn't have to be interupted for screen refresh or do update during VBI, that's enough to put a xl in about the same computing class as an AT, but I still don't know what I'd do with it.

4.19 just doesn't give you the option of 80 track HS. 4.2 (I've heard) has it built in. I haven't booted 2.3 for a while to check if it'd do it. I don't have 3.2 so I've never had a chance to use the Wooley method. I wish I had the ability to do 80 tracks HS, but the longest program I've ever done had about 90k of include files (mostly just byte arrays) & even that would compile in 6 minutes.

3873. System for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-28 06:02:41 UTC
From: seldon@milton.u.washington.edu
Message-ID: <1992Sep28.060241.11080@u.washington.edu>
Source record: 109319

I moved into the PC world about 6 years ago, but never could give up my atari system. I haven't used it, but I was sentimental. Now I think I am ready to give it up (*sniff*). I have a lot of stuff here, and I will be vague about some things, since I am writing this from memory, if interested, I can be more specific, (in other words, unpack it and look). Anyway here goes:

Atari 130XE Stock, No mods.
Atari 600XL w/256k ram, standard mod

The 130XE has power supply, the 600XL does not.

Atari 1050 Drive with ICD doubler
ICD P:R: Connection w/printer and serial cable
Atari XM301 300 Baud modem (Iknow

Atari TouchTablet
Atari Trackball

8 Cartridges: Atari Assembler/Editor, AtariArtist, PILOT language, Star Raiders, Star Trek, Basic XE, Missle Command, Centipede

About 60 Assorted Disks, Games, Programs, etc...
A big pile of assorted manuals, on languages, hardware specs, etc.
If interested, I will even throw in all my back issues of ANTIC, and PSAN
PSAN was a local washington user groups magazine, lots of info in them.

I am asking $200.00 for the whole lot, obo.
I am not planning on breaking down, but might be convinced to do so, on some items..

Reply email seldon@milton.u.washington.edu

Cross-posted to: comp.sys.atari.8bit,comp.lang.logo

I am searching for a version of Logo for the Atari 8 bit (400/800). I would like to either find a PD/Shareware version, or purchase a commercial copy with documentation that is either still sold commercially (prefered) or is being sold used by an individual who no longer uses it.

If none of the above are available, I have seen an 8bit Logo called ATARI LOGO released in 1983. (Blue screen, Turtle icon for the TG, etc.) I'm interested in communicating with someone who might have documentation for this product.

Source record: 109323

Hello Atari followers/gurus.

Its great to see that there are still people interested in one of
the most fasinating little 8-bit home computers in the world.

I bought my first 800 in '83 - sold it in '87. I've always
regretted giving it up ... so I bought a complete system again this
weekend.

Could anyone update me on what's going on in this group? Has
anyone figured out how to transfer 8-bit files over the internet? Are there
any ftp sites or BBS's which still have Public Domain software availible? I'
m also looking for any info on good technical reference material. I used to
be right into programming with BASIC/assembly using Display list
interrupts, PM Graphics, swapping memory (graphics screens) to disk files,
etc.? I'd like to get back into playing around again but I need help.

Any help would be appreciated ...

Thanks..

3880. Wanted - carts w/ children's games, 400/800

3881. I'm back! New deal on Digi-Studio!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-28 15:05:35 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Sep28.150535.561@aber.ac.uk>
Source record: 109325

Hello everyone! I'm back at university after my summer break, so I can now accept email again. Over the summer I was working on package 2 for Digi-Studio. But, due to various problems, it is not quite ready for release. This is the info on it so far:

Package 2 is being developed in the form of a language called LIDS (Language for Instructing Digitizes Sound). LIDS is really easy to use, because I've made all the commands relate directly to sheet music. Here is a typical LIDS program:

```
START TEST
SPEED .7
RS
C3 Q
D3 M
C3 DQ
TS
A2 Q
M
C
TF
RF
```

START is always the first line. The name following is the name of the tune file to create.

SPEED is a facility for using time signitures like 6/8. Basically you can speed up or slow done the tune. SPEED can appear any number of times during the program, just in case the music changes tempo.

RS/RF all music in between these two commands will be repeated.

TS/TF this is used for tied notes.

The notes themselves are just made up of the pitch/octave followed by the duration (in English notation). E.g. D3 M means play a D in octave 3 for a Minim (1/2 note in US music). Q is a quaver (1/8 note), S semibreve (whole note), and so on. Sharps and flats are also available.

A text editor has been written, and this will be part of the LIDS compiler. You will be able to compile straight from RAM or from disk. The LIDS compiler then turns your progam into a .DMS file for use with the tune player on package 1, and the tune compiler (for Basic) on 1.5.

This is the special deal for people in the US who might want Digi-Studio. You can just pay for packages 1 and 1.5 now (which will be mailed straight to you) and get a FREE copy of the new LIDS system when it is avalable. Also,

to make it easy for you, I will take payment in cash in US$. The cost will be $25 (which is going to get you everything). Just complete the order coupon and send it to me with $25 to the address given. Please insure your letter at the post office. This costs $3, and if your money goes missing, you will get it back. I can't be held responsible for lost monies if you didn't insure it. Hopefully this new deal with promote a bit more enthusiasm for Digi-Studio in the US. I hope to see YOUR order soon!!

Also during the holidays, I built a musical keybaord which plugs into the joystick ports, which allows you to play music using a real piano style keyboard rather than the computer keyboard. However, this cost a small fortune to make, and took a lot of hard work, so they won't be built as a product. I just built a prototype for my own use, and for giving demos at shows.

I also built something which I'm calling Digi-Stix. This is a drum stick with a difference, because you don't hit anything with it! Just tap the rythym out with it in the air and the computer will play the drums to your rhythym! The 8 drums available are selected by pressing 1-8 on the keyboard as you are playing the drums. These will be released as a product in about 6 weeks time. Cost in the UK will be 12pounds for 1 stick and software/manual. They will cost more for US orders because of the extra postage costs. More details when they're ready for sale.

I have attached a copy of the Digi-Studio information, just in case you haven't seen it before. I hope to see you all order your copy!

Big thanks to Mike Todd for buying Digi-Studio, and also for sending me lots of disks with the digests on.

Dean Garraghty.
djg0@aber.ac.uk

Digi-Studio Information

Digi-Studio is a new piece of software for the Atari XL/XE series.

It allows you to play music using real sounds which have been digitized.

Digi-Studio comes with a keyboard player and tune player. The keyboard player lets you use your computer keyboard like a piano keyboard to play tunes, but using real sounds, rather than computer-generated noises as is usually the case with this type of program. You can have 3 sounds in memory and can quickly change between them while playing tunes.The keyboard player has responsive keys so that the sound will only play for as long as you hold the key down.Just like a synthesizer!! The Digi-Studio disk contains many sounds for use with the keyboard player, ranging from church bells, to pig grunts, to a baby crying, to screams, and lots of synthesizer sounds. In fact around 25 sounds in all. Why buy a synthesizer when your Atari can do the same?!

The tune player allows you to play pre-programmed tunes using any of the available sounds on the disk. Five tunes have been included on the disk for you

to play.

Digi-Studio comes on a DS/SD disk, and includes a printed manual. It is aimed at everyone, whether musically inclined or not! You may just want to use it for fun, or compose a tune with it! The comprehensive user manual makes it a joy to use!

Digi-Studio will only work on XL/XE computers with 64K RAM. No extra hardware is required. The sound samples just play through your TV speaker!

Package 1.5 for Digi-Studio is now also available offering more features for Digi-Studio and loads more samples and tunes. This extra pack is available with package 1 only. Check the next section for details of this new package.

Digi-Studio Package 1.5

Digi-Studio Package 1.5 is a new set of programs which form part of the Digi-Studio suite of programs and utilities. It is NOT an upgrade to package 1. It is intended to be used in conjunction with package 1.

Package 1.5 contains two new programs for Digi-Studio: The Sample Editor and the Tune Compiler. Also included are 26 new samples and 18 new tunes for use with Digi-Studio.

The Sample Editor allows you to edit existing Digi-Studio samples, and also allows you to create your own by using a joystick. The Sample Editor has facilities for reversing samples (playing them backwards), copying pages of sample to other pages of sample, and also contains facilities to edit samples very accurately using a joystick. This edit facility also allows you to create your own samples. By using all the supplied facilities, you can create some very weird sounds! You can then save your samples to disk and use them in the Keyboard and Tune Players in package 1.

The Tune Compiler creates stand-alone Basic program modules for including Digi-Studio tunes in your own Basic programs. The resulting modules are output in LIST format for merging into your own Atari Basic or Turbo-Basic programs. The modules are self-contained and do not require any Digi-Studio program to play. Just imagine your game starting with a chorus of God Save the Queen in pig grunts, church bells, electric guitar, ..., or your own sounds created using the Sample Editor!

Also included on the disk are 26 new samples, including pan pipes, various guitars, dog woof, organs, synth sounds, and lots of effects! Also, 18 new tunes are supplied for playing with the Tune Player, or for compiling using the Tune Compiler. These include: Yesterday, Hey Jude, View to a Kill, God Save the Queen, Happy Birthday, This Old Man, and many classics.

The manual is in A5 booklet format, and has been typeset using LaTeX, and printed using an Agfa Laser printer. The clear instructions make the software a joy to use!

THIS IS THE NEW DEAL: BUY PACKAGES 1 AND 1.5 NOW FOR US$25, AND GET
A *FREE* COPY OF PACKAGE 2 (TUNE CREATION SYSTEM) WHEN IT IS READY.
YOU MAY NOW PAY IN CASH. JUST COMPLETE THE FORM BELOW, AND SEND IT
WITH $25 TO THE ADDRESS SHOWN. PLEASE INSURE YOUR LETTER IF YOU ARE
USING CASH (THIS COSTS $3 TO DO - ASK AT YOUR POST OFFICE). ORDERS
CAN ALSO BE PAID FOR IN OTHER CURRENCIES. PLEASE CONTACT ME BY EMAIL
FIRST FOR A QUOTE.

-----CUT-----
Please send me:
PACKAGES 1 AND 1.5 NOW, AND 2 WHEN IT'S READY
I ENCLOSE US$25 IN CASH

>
> Jeff McWilliams

I'm using a Supra Parallel interface. I don't think its the
bottleneck, since using Print Power it prints a lot faster than my
program.

Thanks!

What exactly is different in the 6502C? I know there are some additional
circuits inside. I don't know what kind of logic, though.

Could anybody post a diagram showing the pinout of both the
original 6502 and the custom 6502C? I'd very appreciate it.

I don't know it at the moment: does the PBI have the processor's
HALT - line?
If it is the case, I wonder for how long the processor can be stopped
with this? What can you do during that time?
Would it be possible to access the DRAM within the HALT-period?
How often?

Another question: Would it be possible to change more than one RAM
address of the Atari's internal DRAM during one single clock cycle
of the 6502C CPU?
Is it very complicated to accomplish an external DMA on the system?
How does the DMA work on systems like the ST or Amiga?
Any ideas how to implement this kind of DMA on the 8bit?

Marek Tomczyk

> IS there a difference?

There's no difference. Some UUdecoding programs are pains in the *sses,
(like Yau ;)) but others are ok (like Mufud on this BBS (which runs
Waffle on an IBM)). I've yet to see a GOOD one ;). (at least waffle can
work with seperated files, rather than you needing to delete all the
headers and append files together).

I'm actually thinking of working on a better UUd/UUe program. It
probably won't be as easy to use with SpartaDOS, but it might be a bit
more efficient (I notice that UUe'd files never use lowercase. I'd fix
that (somehow!)). If you rumage around some other binary groups (like
the CrappleII group, for instance) you'll see that the files aren't
uuencoded, but encoded in some other, more applish way. It actually
might be BETTER. If only I knew how to program on the IBM (or Unix..yeah
Unix..duh..isn't that what the archive runs on.. I'm so lost!) Anyways..
if we were to POST binaries, a simple ML or BASIC program might be a
handy-dandy something. But I guess for BART mailed stuff (and FTP'd? I
can't do FTP grrr!) it'd have to be trusted to good ol' YAU..

Whaddaya say? Should I start hacking together yet ANOTHER decoder? ;)

billt@NeoSoft.com (Bill Tart) writes:

> How can it be fixed so that a 130xe can send out a CR/LF much like

THere are a few ways. If you're using BASIC.. change the program from
doing this:

```
10 LPRINT "Hello"
or
10 PRINT #PRINTERIOCB;"Hello"
```

to this:

```
10 PRINT #PRINTERIOCB;"Hello^M^J";
```

The "PRINTERIOCB" would be whatever IOCB you have opened for the printer
(with an OPEN #PRINTERIOCB,8,0,"P:") and the "^M^J" would be the
[CONTROL]+[M] and [CONTROL]+[J] characters.

Or, if you are using something like a word processor...have it print to
disk, rather than to printer ("P:"). Then run this little program:

```
10 OPEN #1,4,0,"DX:FILENAME.EXT"
20 OPEN #2,8,0,"P:"
30 TRAP 100:DIM A$(132)
40 INPUT #1,A$
50 PRINT #2,A$;"^M^J";
60 GOTO 40
100 CLOSE #1:CLOSE #2
```

Again, the "^M^J" is the two control characters.

Your final choice is to wait for someone knowledgable with the 850 to
tell you what to do! ;)

I think mine had problems with my MIO, using a computer that also had a newell 256K upgrade in it. Others say the Black Box and it aren't compatible. Some claim it is just becasue the timing of the ROM PBI routines are off.. nobody really knows though do they?

Hmm, well, what I am basically after, is a machine that I could write
a sort of CAD program on. I'd like it to be my 8 bit, rather than
going out and buying an ST or something else... mainly because I can't
afford that kind of thing, and because I still my Atari 6502.
But I think to do any sort of decent vector based calculations,
and to store things in memory, it would be ALOT nicer to have a
16 bit C compiler, for memory access reasons, and a faster CPU,
for speed reasons, in the calculations. Next, I want to print the out-
put at 360dpi on my 24 pin printer, which would hog a lot of memory
composing an entire bit mapped page and then sending it to the printer,
or, loop through the entire drawpage routines several times, each time
contstructing only a part of the page, printing that part, and then
going onto the next section. That would also be processor intensive.
I am also hungry for a better WP program. The 65816 has the OPCODES
to do a Textpro like program that can support a text buffer on 64K or
greater with ease. The main thing that slows Tpro down during
editing time, is that when you insert a char, it has to move the whole
document from the cursor position to the end of the document, down
by one. The MVP and MVN commands would really help this with the

65816, not to mention the 16 byte registers and stuff, you wouldn't have to worry about banking, and the hassles of that.

ALL MICRO SHOW 6

BINGLEY HALL, STAFFORD, ENGLAND

SATURDAY, 14th NOVEMBER 1992, 10a.m.

This is THE show to attend for Atari 8-bit support and products. This is a general show and radio rally, but the Atari makes up a lot of the show. Exhibitors for the Atari include: Dean Garraghty, Page 6, Micro Discount, Gralin International, BaPAUG.

If you're in England around this time, come along to Stafford, or even make a special journey across. You'll be glad you did! If you need further details please email: djg0@aber.ac.uk.

OK, I still think it's a lot of club considering the distance to the green.
A 'C would be tough to get, but how about Action! for a 65816? I don't
know if you've seen the run time package yet, but it's just code blocks that
relocate/duplicate the routines that are built into the cartridge. All that
would be required is to recode them for the 65816. There's a public domain
cross assembler (TASM) that you would just have to add the extra op codes to.
It's table driven so that's easy enough.
I guess by application I mean something a little more dedicated & novel then
something that just does an existing operation better. For instance,
something like a log engine. Have enough memory so you could keep the entire
log tables in memory & maybe something silly like 74ls559's(#?) that do
multiplication for when you have to raise something to a power. Or turning
an Atari into a tool, like the cable people do for their broadcast.

3898. Beginner's Guide to Ftp

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-29 16:04:47 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep29.160447.6624@terminator.cc.umich.edu>
Source record: 109206
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.
~~~~~~

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

3899. atari archive frequently asked questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-29 16:08:08 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep29.160808.6841@terminator.cc.umich.edu>
Source record: 109339

[Please remember that John Dunning, jrd@atari.archive.umich.edu, maintains
the 8bit section. Thanks.]

Welcome to atari.archive.umich.edu's Frequently Asked Questions

Updated on: Sept 29, 1992

1. How can I access the archive?

You can access the archive in one of two ways: by our mail server, BART,
or via anonymous ftp. To get information on the mail server, please
send mail to atari@atari.archive.umich.edu with a body of 'help'. For
information on anonymous ftp, please refer to my 'Beginner's Guide to
Anonymous FTP,' which is frequently posted here. Questios about BART
should first be addressed to the help file, then to Jon Brode,
jon@atari.archive.umich.edu.

2. When I try to log in via ftp, I get a message saying that the archive's
host won't accept anonymous ftp from my machine because of some
mapping problem. What can I do to fix this?

The archive's host machine will attemt to map your machine's ip address
back to a name. If it is unable to do this, it will not let you
begin an anonymous ftp session. Please ask your sysadmin to check the
name server entries for your machine, as something is amiss along the
way. If he or she isn't able to solve the problem, please have them
send mail to me and I'll have the folks here take a look and see what's up.

3. How can I upload things to the archive?

You can upload via ftp or by sending uuencoded chunks to me (address below).
Please refer to 'How to upload to atari.archive' (frequently posted here)
for more information.

4. After I've posted files to the archive, it often takes a few days before
they're available to the public. What sort of queueing system do
you use?

The queueing system in place here is known affectionately as my spare
time. I try to make files available as soon as I possibly can, but
often times my schedule dictates otherwise. Please bear with me.

5. What is {MiNT, TeX, Gnu, etc.}?

Please refer these questions to the authors of the software. Often times
I know very little about a piece of software that is posted here.

6. What is the ip# for atari.archive.umich.edu?

141.211.164.8, at least for the time being. It's a good idea to always use the a.a.u.e name.

7. What are the ???s in the index for?

A ??? signifies that I don't know what the file is or does. Please feel free to contact me should you happen to know the answer.

8. Where can I go for more information about the archive?

Please feel free to send mail to weiner@atari.archive.umich.edu and I'll try to answer your questions. Questions about BART should be addressed to its author, Jon Brode (jon@atari.archive.umich.edu).

9. Isn't there some times that I shouldn't ftp?

Yes. Please try to keep your ftp use between the hours of 5 pm to 7 am, EST. This will greatly appease the people that actually work on this machine. We are generally -4 GMT.

Cheers,

3900. Upgrading my 810 and ALT.Atari.8bit.Binarys

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-29 17:05:54 UTC
From: kspeicht@kilcom1.ucis.dal.ca
Message-ID: <kspeicht.27.717786354@kilcom1.ucis.dal.ca>
Source record: 109347

I have a 810 drive.

According to the FAQ I need a 190k diskette in order to transfer
files from my Unix terminal to my 386 PC then onto a Mydos diskette.

Since the 810 is a 88k disk drive, I think I have to modify it.
Does anyone know of a hardware vendor who sells and upgrade kit for it?
Or, should I just get a Indus GT drive. If I need to purchase a better
drive (ie Indus GT or something like it), who sells them.

Also the FAQ said something about Mydos has hard drive support. Who
sells hard drives for the Atari?

About the discussion about the binarys news group. How about...

Alt.atari.8bit.binarys.

My Boss said he could create an Alt group in around 8 seconds, it
would then take around a week to propagate around the internet.

I assume this has been thought of already but dismissed because some
sites don't allow alt groups.

3901. Re: Quest for Refresh

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-29 19:10:31 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92273.141031JJMCWILL@MTUS5.BITNET>
Source record: 109346

Rick,

Hmm, interesting. There IS a 16 bit assembler, but to convert Action! ?,
wow, sounds heavy. I think you would have to rip some of the guts out,
since pointers could not be 24 bit, as would any values returned from
malloc(). Also, I believe that if you are running code and you come to
a 16 bit boundary, like $1FFFD, you have to put a JML $20000 to cross the
boundary, stuff like that would have to be handled. That's all parser stuff
basically. If someone could come up witha 65816 parser, then writing the
a library of functions wouldn't be hard. But again, since you now have
24 bit pointers, you need to be able to do 24 bit operations on that.
Sure you could cludge a bunch of routines, like longc=longadd(longa,longb)
but it's not very convenient.

I can think of at least two tools that could really use the advantages of
24 bit memory addressing and stuff, one being a nice schematic CAD program
for all us Hardware folks, and Ben Poehland has been looking for a chemical
CAD type program for years. I started working on a Schematic CAD program.
I wanted something that could output to whatever kind of printer a person
had, 9 pin, 24 pin, laser. Which means the drawings have to be scalable.
that means a vectored approach to how things are described and drawn.
And since you can't see a whole 8.5x11 page at once, you could zoom in
and out, but it would still be nice to have a virtual page, say 600x400
pixels, that you pan around in when working on a drawing. How about
memory to store the symbol libraries? and text fonts? and then the
mathematical description of the working file. ALl that takes memory.
I found it extrememly uncomfortable to work with banked memory, especially
since some upgrades have Antic following banked, others don't, some are
inbetween. It can be a nightmare. And I'm not a Machine Language genius,
I need to have some high level language to really get anything done.
Hence my craving for a 65816 type C or Action!. Some Apple guy said he
knew there existed source code for a small C compiler, like CC65 or Lightspeed
C, that created an ANSI C compiler. That would be cool, except he didn't
know where to get it. Maybe something similar could be done for us.
CC65 outputs machine language files, which are then assembled. This means
the intermediate code could be hand optimized. It's a big project thought,
nothing I could tackle what with school beating me over the head with
lab report deadlines and stuff.

Jeff

3902. Need info on connecting a RGB monitor to an 800

Newsgroup: comp.sys.atari.8bit

Well, using a PUT #1 or even a quick CIO call (hey, even somehow sending every 40th byte from a bit of memory at ML speed would be great! don't ask me how to do it tho!) would probably be faster than Print#1. Perhaps post the file (or mail it to me) as a listing. I could hack it up a bit easier if I saw it.

For anyone interested in a routine that ROTATES characters (for printing them upright), here's what I've come up with:

```
50 FOR C=1 TO LEN(TEXT$):Z=ASC(TEXT$(C,C)):INV=1:IF Z>127 THEN
Z=Z-128:INV=-1
52 Z=Z-32:IF Z>63 THEN Z=Z+32:GOTO 55
53 IF <0 THEN Z=Z+96
55 FOR J=0 TO 7:H(J)=PEEK(CH+Z*8+J):P(J)=(255*(INV=-1)):NEXT J
60 Q=256:FOR J=0 TO 7:Q=Q/2:F=256:FOR M=0 TO 7:F=F/2
65 IF H(M)>=Q THEN H(M)=H(M)-Q:P(J)=P(J)+(F*INV)
69 NEXT M:NEXT J
```

..... that rotates the character. From there you can do things like a 8x8 character banner dump, a 8x8 character hi-density graphics dump, etc.

note that the following things are required before line 50:
TEXT$ - the text you want to print (manipulate)
H(7) - just DIM this...it gets used
P(7) - DIM this as well...it stores the rotated character's byte values.

also, at the end, you need a "NEXT C" to finish up printing the rest of TEXT$.

Confused? Thought so. If anyone has any questions, just reply or mail me about it... I'm not a good teacher (esp. about things I programmed years ago! ;))

Well, I don't really know enough about the extra opcodes for the 816, but
I just assumed there would be stuff like STZ indexed with 16 bit registers.
Since about 1/2 the stuff programs do is just move memory around,
the routines could just be added to take care of string copy etc. I'll get
off my rear & UL a source file so you can see how easy it is to extend
the Action! language. I'll pass up to the equivalent of 16 bytes of
data that can be used as pointers etc. Since there's no syntax checking on
code blocks you can stick anything in them. Basically, if you can write
a USR() routine for Basic that can access the chip the way you want, you
can do the same thing in Action! For instance, you may want a routine
that will more more then 64k, you just write it in assembler then add the
code block with whatever name you want & presto! You can either have it
generic so you can relace the built in MoveBlock() or call it BigMove().
I'll go back to my lit & see if I have anything on the new codes (unlikely).

3908. Re: Quest for Refresh

Newsgroup: comp.sys.atari.8bit

Source record: 109178

Rick,

Yes, I am aware of how Action! passes parameters via the page Zero locations, and A, Y, X registers when the routine is called. There ARE opcodes like STZ, and even some special opcodes for moving blocks of memory, up to 64K in length, all at once! What leaves me floundering is that you couldn't make a 24 bit pointer in Action! You would need one to point to anything in memory above 64K, say, if you had a 256K SRAM card up at $40000-$80000. How could you allocate some of that RAM, say to store a UUdecoded file, which you're going to decode, because that just happens to be what you're writing the program to do? Sure, you could fetch the stuff from highmem in chunks, say with a routine called GetFromHigh(lowptr,hiptr,numbytes). But ick, bleck, ack, cough, gag. It feels like segmented Intel memory or something. Even that routine requires a 24 bit pointer. Well, I suppose you could do a .DEFINE LONG byte array [3] or how ever that works, I'm at school and can't remember the Action! syntax. But then you also would need something like a IncLong(Longptr), a DecLong(Longptr), and maybe a AddLong(Longptr,Any_integer), and a SubLong(Longptr,Any_Integer). See, it would be nice if Action could intrinsically handle Longpointers, so you could just do a :

```
Longptr==+
NextByte=FileArray[longptr]
If NextByte=155
nextByte=19
OutArray(Longptr2)=NextByte
.
.
Loop, or whatever
```

I am using Pseudo syntax code here, very foggy on Action, or anything for that matter. Hopefully you will get what I am driving at. Am I being too picky by not accepting that we'll just have to live what defined functions to make up for what Action! can't do intrinsically? Somebody throw me a tether if I start levitating off of the world of reality okay?

Jeff

3910. P:R: Connection Help

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-30 05:46:50 UTC
From: pattons@CS.ColoState.EDU
Message-ID: <9209300546.AA12313@beethoven>
Source record: 109353

I recently pruchased a P:R: Connection second hand and have been having problems hooking it up... Afew questions for anyone out there that can provide me with some help...

1) Do you have to write an R: handler for each individual modem? I thought the connection had the Handler built into it. I am trying to connect a Codex 5212R modem which is ancient and I do not think that it is Hayes compatible. Does anyone know if this can be done? This modem is 1200baud and has some major switches and such inside. "Inherited" it from my uncle.

2) Concerning cables... Is it best to build your own or do standard IBM cables for connecting RS232 devices work. I bought a Male 25 pin to Male 9 pin to hook up this beast but I am not sure that the pins are correct for the P:R:.

I guess I am asking ... Is the P:R: connection pinout config. match that of standard cables?

3) Are these 15 pin to centronics printer pinned cables still commercially available or are they also a build only type item (I haven't had a chance to look into availability of these yet.)

4) What do you use the RS232.SYS file on the P:R: Connection disk for if the hardware already has a built in driver??

Also, I may be needing a cheap 1200 or 2400 baud modem that IS Hayes compaati-ble, so anyone with one.... Contact me I guess.

Thanks for any help that you can provide....

>Or, should I just get a Indus GT drive. If I need to purchase a better
>drive (ie Indus GT or something like it), who sells them.
>
Nobody makes floppy drives for the Atari 8-bit any more, not even Atari. You just have to look for used drives for sale. And I don't think the 810 could be modified for double density, but the 1050 can.
> Also the FAQ said something about Mydos has hard drive support. Who
>sells hard drives for the Atari?
Computer Software Services in Rochester, New York. Their interface doesn't work with the Atari 400, 800 or 1200XL. You need an 800XL or 130XE computer. Their interface, called the Black Box, includes a SCSI hard-disk port, a parallel printer port, and an RS232 port. There's an optional add-on board that lets you use IBM-compatible floppy drives.
>
> About the discussion about the binarys news group. How about...
> Alt.atari.8bit.binarys.
>
A better name would be Alt.binaries.atari.8bit. Sure, some sites don't get alt groups. Some don't have ftp. Some only get mail, and they say some get Usenet but can't get mail. You can never please everyone.

The Apple][groups use BINSCII, which is actually a lot nicer than
uuen/decoding. You can run each part of a binscii file through in
whatever order you choose and it can put the binary file back together.
I've thought about writing one for the 8-bits, but they are supposedly
working on BINSCII II that is supposed to be better. I had a long
discussion with some of the Apple][groups and binscii sounds a lot
better than uuencoded.

>1) Do you have to write an R: handler for each individual modem? I thought

The handler is built in, use RS232.sys or rs232.com to "boot" the P:R:
connection and read the ROM into memory. Your atari will make a familiar tone
through the monitor speaker as the P:R: Conn. boots.

>2) Concerning cables... Is it best to build your own or do standard IBM cables

>I guess I am asking ... Is the P:R: connection pinout config. match that of
>standard cables?

I made my own serial cables, so I don't recall if they were like "standard"
cables. (I had never seen a 9 pin to 25 pin cable at that age) The cable IS
"standard for an atari 8-bit" in the sense it's the same cable you'd use for
an Atari 850 interface.

>3) Are these 15 pin to centronics printer pinned cables still commercially
>available or are they also a build only type item (I haven't had a chance
>to look into availability of these yet.)

Same goes as for the serial cable.

>4) What do you use the RS232.SYS file on the P:R: Connection disk for if the
>hardware already has a built in driver??

See 1) above. RS232.SYS is (as I recall) an Atari DOS 2.0 file, but EVERY Dos
I've seen has an rs232.* file that will boot your P:R: connection (same file
that boots an 850). Some software will boot your P:R: Connection as well. I
think Express 850 did that (w/o using a rs232.sys file).

Good luck Sam!
jc

3914. News-Disk

Newsgroup: comp.sys.atari.8bit
Date: 1992-09-30 13:56:57 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Sep30.135657.5231@aber.ac.uk>
Source record: 109205

Over the holidays, I produced issues 6,7, and 8 of the News-Disk. These are all on the archive. Issue 6 is in the Djg directory, and 7-8 are in the New dir. On issue 7 (in my editorial) I ask all non-UK readers to let me know they are reading it, and also for their comments relating to the News-Disk. If you get and read the News-Disk from the archive or other BBS, then please email me. This is so I can try and get more accurate reader numbers.

Also, now that the News-Disk is available easily to many people, I would very much like to see submissions for the News-Disk. I accept articles, programs, reviews, tutorials, or anything which would be of interest to others. Please email your articles to me: djg0@aber.ac.uk. Non-ASCII items (such as programs) should be UUencoded before mailing.

Dean Garraghty.
Editor, Atari 8-bit News-Disk.

my 1050 to be able to read 180K disks.

Thanx in advance, Edo.

3916. Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-01 01:08:18 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GPEP0GIK4M8WW7GU@carleton.edu>
Source record: 109210

Changes since last time: too many to list! (or for me to remember)

The 8-bit Atari
Frequently-Asked Questions List
for the Internet

Posted on or about the first of the month, simultaneously to:

the Usenet newsgroup
comp.sys.atari.8bit

and

the Internet mail-list
Info-Atari8 Digest

which are, in fact, one and the same group.

Revised 25-Sep-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All postings to comp.sys.atari.8bit automatically appear in the
Internet's Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All contributions to the Info-Atari8 Digest automatically appear
on Usenet's comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning,
jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

If you receive nothing within a day (it should take just a few minutes), include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This can be useful for UUCP and other addresses that BART may not be able to figure out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should only be posted to the discussion group as a last resort.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively.

To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K

format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

End of FAQ list.

>
>Thanx in advance, Edo.

You would probably be better off with an Atari XF551 drive.
If you can find one, that is.
This is just my own opinion. If there is a reason that the 1050 would be preferred over the XF551, I don't know of it. Unless you really need a drive with a "Happy Backup" upgrade.
I've owned two 1050's and they continually break down. My XF551 has run without a problem since 1988. On a related but _unrelated_ note, my Atai 810 drive has been operating since 1982 without any breakdown or trouble at all. It's an MPI version. Noisy, but extremely reliable.
Just my $.02 worth.

Uncle Fester

Oh, a US Doubler is what you need, or a Happy mod.

About a year ago, I bought the Atari 8bit version of Silicon Dreams, by Firebird software. I played the first of the triad until I couldn't see straight anymore. I finally gave up when I could not figure out how to get by the "waldroid" near "Jacob's Ladder."

I recently gave it another shot, but I'm still stymied. Can anyone give me a hint? Also, where are the "dark glasses" for welding?
Email or post ...Thanks

Isn't there a Happy for the 810? Doesn't it allow the 810 to read/write SS/DD
180K disks, like the Happy 1050 does?

Source record: 109217

The Happy upgrade for the 810 drive does _not_ allow it to read/write SS/DD disk formats. Everything remains the same except for its ability to copy disks. It will read and write faster also.
I have one installed in mine.
The 1050 is a 'dog' as far as I'm concerned though. It was a slightly good idea that Atari came up with, but enhanced density aside, it is a shoddily designed drive that is prone to failure in many aspects both mechanical and electronic. I have two that have had to be repaired many times even though they were not used as heavily as my 810 or XF551.
If someone desires the ability to transfer files in MYDOS double-density format between the Atari and a PC, I would seek the XF551 rather than the 1050. Unless you want a Happy 1050 for making back-up copies of protected software that is.
Again, this just my opinion.
Caveat emptor!

I'm writing (WAS writing.. will start work on it again soon. Sorting out
my free time, with school and all) CrashMan in TurboBASIC XL.
UNFORTUNATELY this makes it incompatible with the 400/800 series (unless
they have an XL OS chip), but hey, that's how it goes. My next version
(or game, if I don't come out with a sequel) will PROBABLY be in Quick or
Action! or even maybe C, but most likely Quick or Action!.

Thanx for the interest!!! :)

Yes there is... I had a chance to buy one but I think that the 810 case
is too bulky to go very well with my XL stuff due to my limited desk space.

It did write SS/DD 180k along with all of the copy 'perks' of the chip.

You were commenting on the speed of Textpro and how it takes a while to insert text far from the bottom of the end of the file. How exactly is this done? I was working on a SIMPLE editor in TurboBASIC and when I tried to insert in the string, I'd get a repeated byte, so I tried using the MOVE command, and it did the same thing, and finally I used the -MOVE command, and it worked like a charm. What >I'd< like to know is how a word processor handles screen display. I was thinking that simply forgetting about [RETURNs] and displaying them as inverse [ESC]s would do, but ended up just rePRINTing the text (byte by byte!!) until the cursor was at the bottom of the screen (oh, I also had location 766 set to 1, so all editor commands would be displayed instead of done). Is there any quicker way of doing this? Even with the HyperE: screen accelerator AND the program compiled, it's quite slow. Would having say a machine language routine to replace PRINT help? I think it would. All it would do is PRINT like normal, until it got to the bottom of the screen, then it would abort itself. Is there already anything like that out there? Is there a simpler way of doing all this? Am I just nuts in using this PRINT idea?! All and any help would be much appreciated. (I'm working on a simple MyDOS CLI program. It was originally in BASIC, and now it's in TurboBASIC and know me I'll get it over to Action! any day now!)

Thanx in advance!

Are there more than one chip version for the 810? I could swear that the enhanced 810 I saw wrote in 180K since that was a major selling point of the drive...

3929. Atari 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-01 23:56:36 UTC
From: dam1@ra.msstate.edu
Message-ID: <1992Oct1.235636.2639@ra.msstate.edu>
Source record: 109223

I have finally decided to sell my Atari 8-bit system,
it includes the following: (this is an updated list)

Hardware - 800XL with RAMBO XL (256K) - $75
1050 Disk Drive with US Doubler & SpartaDOS 3.2d - $75
1020 color pen plotter/printer - $10
256K Multi I/O Board - $75
ICD hard drive kit - $75 ($100 includes 20 meg HD)

Accessories - 5 joysticks
1 set of paddles
1 ICD printer cable
1 ICD modem cable

Software on disk - Bank Street Music Writer
The Converter version 1.51
Paper Clip
Print Power
The Print Shop
RAMbrandt version 2.0

Games on cartridge - Asteroids
Star Raiders

Games on disk - Alternate Reality - The City
Alternate Reality - The Dungeon
Artic Antics
ballblazer
Boulderdash Construction Set
Chessmaster 2000
David's Midnight Magic
F-15 Strike Eagle
Hacker
Jawbreaker
Jewels of Darkness
Leaderboard Dual Pack
Master of the Lamps
MRCA Mach 2
Pinball Construction Set
Quest of the Space Beagle (no docs)
Silicon Dreams
Tail of Beta Lyrae
Temple of Apshai Trilogy
Gateway to Apshai
Trail Blazer

Books - Basic Atari BASIC
De Re Atari
Mapping the Atari, revised version (includes XL stuff)

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: May, July, Aug/1985
May*, June, Dec*/1987
Feb, Apr, Nov*, Dec*/1988
* these issues include the disk

Except as noted, all hardware is in great condition and all software includes documentation.

I also have over 50 dd/ds SpartaDOS formatted disks with shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

Marek Tomczyk sez:
"Just my $.03 :-)"

I'll add another $.02 to my original to make a total of $.04.
In regards to your 1050 reading DD format disks: Yes...but that's only one side, right? The XF551 is good for _both_ sides.
I'm sure there are _some_ good 1050's out there like yours, but with my owning two of them with the repeated failures means I must have had some really, really, really bad luck or someone "up there" doesn't like me.
I purchased them new, not used also. Oh well. Go figure.

Your turn to up the ante. :-)

Uncle Fester

I wonder if the guy that started all this is getting anything out of all this "nyah, nyah, nyah" talk?

Sorry. Wrong. The Happy upgrade for the 810 does not allow reading of
SS/DD 180k disks.
Where did you get this bogus information?
The only Happy upgrade that allows reading SS/DD 180k disks is for the
1050 disk drive.
There was a 'vaporware' product (never released to my knowledge) from
another company (not Happy) called "Turbo 810" that was supposed to do
that. Perhaps you were thinking of that instead?

If there was one, it was not in wide release. Besides, if you disassemble
the code that comes with the product (or list the file that is for you to
use in your own programs) you will see that the software is written to
handle only single density and 720 sectors.
I still think you must be thinking of the 1050 version or the
never-to-be-seen "Turbo 810" product that I mentioned before.
Another problem with the 810 being capable of any sort of Double Density
is the structure of the read/write head itself. It couldn't produce a
'field' fine enough to discriminate properly.
Cheaper to produce and one reason that the drive was only capable of 88k.

I think that maybe the guy with the drive just wanted to sell it real bad.
Some people will try to turn a buck anyway they can.

At least there are people on here (comp.sys.atari.8bit) that are
knowledgable enough to remember all of this upgrade stuff and fill in the
rest of us... (at least me)

3935. Video game list

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-02 12:35:00 UTC
From: 0005441819@MCIMAIL.COM
Message-ID: <92921002123529.0005441819PK1EM@mcimail.com>
Source record: 109231

Does anyone know the address to subscribe to the video games mailing list that deals with the Atari 2600 and 7800?

Thanks,
Lawrence Estep

3936. SIO2PC ... What is it??

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-02 12:57:18 UTC
From: kspeicht@kilcom1.ucis.dal.ca
Message-ID: <kspeicht.35.718030638@kilcom1.ucis.dal.ca>
Source record: 109232

Some one mentioned that there is a program called sio2pc. This program supposedly is loaded on the pc and allows msdos to write to an ataridos disk (I hope 88k 810 format). The files transferred are then able to be read by the atari.

Is there a program out there that does this? If so has anyone used it and how well does it fly??

3937. Championship Lode Runner

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-02 13:10:23 UTC
From: rac@sherpa.uucp
Message-ID: <1992Oct02.131023.16449@sherpa.uucp>
Source record: 109233

I no longer own an Atari, but when I did, I played Lode Runner and Championship Lode Runner. My boss still has an Atari and wants to get Championship Lode Runner for it. Does anyone know where he might get it via mail-order?

Thanks

SIO2PC is a hardware/software mod that connects your 8bit to your PC.
It allows you to store your Atari excecutables on the hard drive of your
PC and you can even boot your Atari from the PC's drive.
It doesn't allow you to write to an Atari DOS disk. You can transfer
files with it from the PC to an Atari drive that is in the serial chain.
SIO2PC hooks your Atari to PC via the Atari serial port to the PC's serial
port, so your PC's hard drive is like drive #1 to your Atari.
For your PC to actually write to an Atari double density MYDOS format
diskette you need UTIL. This is a good program that is available at the
archive at umich. You need a drive on your Atari that formats in MYDOS
SS/DD or DS/DD in order to use it. An 88k 810 will _not_ work because of
the type of drives that the PC uses is not compatible with that and cannot
emulate it.

I've been using SIO2PC for some time and am extremely happy with it.
It is not, however, what you seem to think it is...

First of all, I do not believe that there exists any program that will allow you to read or write single density (90K 810 format) or enhanced density (130?K 1050 format) disks on a non-Atari machine. Please correct me if someone knows better [My 1050 died, and I really need to copy off those enhanced density disks].

Now what SIO2PC does is let you use your PC as a fileserver for your Atari. It is a combination of a hardware device and software for the PC. The hardware device plugs into the Atari like any disk drive would and plugs into your PC through the serial port. Your PC then runs a program that interprets the Atari (SIO) signals and responds appropriately to make the Atari think that it is whatever drive you want it to look like. I have most of my stuff on one "disk" which is actually an 8meg file on my PC's hard drive.

Source record: 109235

```
;I know it's supposed to be 80 columns
;but I decided to add a few other modes
;just to show how you can mix modes
;The term just uses 80X24 though
;user prompts can be anything including
;Drawto x,y etc.
;
;The character set is laid out in the
;middle of standard set. It's shrunk
;down to 80X32 so it can be redone for
;a little more detail. Depending on
;where it goes, it shifted RT or LFT
;then combined with the existing screen
;data:
;
;00000000 00000000
;000X0000 0X000000
;00X0X000 X0X00000
;00XXX000 => XXX00000
;00X0X000 X0X00000
;00X0X000 X0X00000
;00X0X000 X0X00000
;00000000 00000000
;
;I'm going to be moving the screen from
;just under cart to 4k below, it has
;to be 4k to make the GR. 8 screen RAM
;properly aligned for DR. xxx,xxx etc.
;this gives me the ability to scroll
;W/O moving the 1st 320 bytes of the
;Cart to screen RAM. Since I've got
;all that extra space, I'll put some
;variables & Buffers there. There's
;enough room left to add a PM cursor
;& some transfer utilities. Just don't
;have the time myself right now, but
;anyone who want's to add them is more
;then welcome. The .COM file has been
;compiled & had the P:R: handler
;appended. You may have to change the
;program start depending on the DOS
;you use & size of your handler.
;Keep the FONTs on drive 1 unless
;you want to recompile with different

BTW: I just logged in using the terminal, & noticed it was doing double
spacing on the net. I just dropped the:
IF Zap=10
stuff i.e. deleted it to get it to go right. This program assumes you have
the fonts stored on D1: with the right names & that you've loaded the
R:handler. The fonts are explained in the program. I'll see if I can
get the writting an action function here also.

3942. ATARI CLASSICS: UPDATE

Newsgroup: comp.sys.atari.8bit

********** A T A R I C L A S S I C S **********
TE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDA

Well, I've been keeping kinduv a low profile the past few weeks. With good reason: I've been hard at work on the Premier Issue of Atari Classics.

Our first issue will be 32 pages cover-to-cover. It will be distributed for free beginning Oct. 10 (the kickoff of our subscription drive) at the WAACE AtariFest in Reston, VA; and it will contain a subscription form in the back (we will even take VISA/ MasterCard!).

I just received the proof copy of the Premier Issue a couple days ago. It looks nice by any standard, but actually it's a miracle considering the unbelievably short time that elapsed between the time AC started from nothing (August 5) till the copy deadline of Sept. 19. I mustah been plumb crazy to think I could locate & hire a staff of 15-20 people, get them to write stuff, solicit ads, & throw together a professionally printed magazine in six weeks.

Fortunately, as most of you know- I *AM* crazy- which is probably why AC is now rolling forward with irresistable momentum. The magazine is now at the printer, & latest word from our Publisher is that it will be ready early next week. I'm now biting my nails to the quick wondering if the 500 issues I'm supposed to distribute at the Fest will arrive before I depart for Virginia on Oct. 9. Lotsa fun, waiting. Gee, what's that gnashing sound? Wups.... my teeth again.

We'll start officially accepting subscriptions the week of Oct. 12. You can still get on our mailing list for a FREE complimentary copy of the Premier Issue by sending your POSTAL MAILING ADDRESS to:

ATARI CLASSICS
179 Sproul Rd./Rt. 352
Frazer, PA 19355 USA

We prefer that you should get our magazine in your hands first. If you like it, just snip out the subscription form in the back, fill it out, & send it in with your payment.

Up till this year I was just a simple research chemist; this Managing Editor stuff is new ground for me (I'm still a chemist, only now I do Editor stuff at night). During that final week prior to the copy deadline our vendor community had a feeding frenzy. If you guys out there think you're desperate for an 8-bit magazine, let me tell you our vendor/developer community is just as desperate. Consequently, the Premier Issue ended up being something like 30% advertising. And we didn't even try very hard.

Now, for issue #2, I'm working with our Advertising Editor to blitz every known 8bit developer/vendor to let them know we exist & are offering low commercial ad rates. The ad solicitation campaign will kick off the same time as our subscription drive. It is AC's intention to rattle every cage & breathe new life into the corpse of every 8bit vendor we can dig up (which is what we might have to do for some of them!).

Provided vendor support for the magazine continues strong- AND if we get a strong response to our subscription drive- well, um... mumble, mumble... >cough, cough<, maybe our Publisher will let us go to 40 pages for issue #2 ???

Stay tuned, everyone.

- BEN POEHLAND
Managing Editor,
ATARI CLASSICS
"The Magazine for the Dedicated 8-Bit User"

****

3944. MyNI_DOS

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-03 21:28:51 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <s783RB2w165w@cyberden.uucp>
Source record: 109244

I've converted my MyDOS CLI program "MyNI_DOS" over to TurboBASIC XL (bumping it up to version 1.1) and from there, I'm translating it to Action! (making it v.1.2).. the thing is, the TurboBASIC XL version WORKS (because I'm not even near done with translating it to Action!), and I'm wondering if anyone would be interested in testing it, and eventually me uploading it/posting it. It's getting near 10 or 12K I think, and fully supports MyDOS directories. The current commands are:

CD-change directory
MK-make directory
DIR-show directory listing
DEL-delete file
COPY-copy file
REN-rename file
LOCK/UNLOCK-lock and unlock files
LOAD-load a binary
RUN-run a binary
RUNB-run a BASIC/TurboBASIC XL program
RUN@-run at address (call an ML routine from memory)
GET-get a block of memory
PUT-put a block of memory
TYPE-type out a file (sort of like COPY from E:ditor)
SHOW-display a file (opposite of TYPE)
EDIT-loads a file and lets you edit (with a VERY crude, slow and buggy editor)
ERR-show value of last error
PAUSE-used for pause commands on/off during DIR and SHOW commands
POKE-works like both PEEK() and POKE in BASIC
?-shows list of commands (no descriptions)
Dx:-change drive
BAT-open a file and read from it instead of the keyboard (batch file)
ECHO-turns on & off echo (when on, the commands being read during a BAT command will be displayed)

Appending "/S" to the DIR command's filemask will sort the directory before it is displayed (or sent to file/P:rinter, etc.)

Appending "/Q" to a filename will abort the command if it already exsists. (if you want to TYPE out a file, for example, and you weren't sure if it was there already or not, (this is good for in a BAT file), just append "/Q" to the name and the command is not done.)

Appending "/A" to a filename will open it for append (if the file is being open for write). (If you wanted to COPY two files together, just type something like "COPY FILE1,FILE2/A" and FILE2 will be added to the

end of FILE1.)

Other commands such as TREE (shows all directories and where they are), FIND (finds a file inside directories), FORMAT (oops, forgot that one in the beginning!), IF and REPEAT/UNTIL & WHILE/WEND type of looping may be added to BAT file running (as well as nested BAT file running!), the ability to use variables and strings (ie, have a small BAT program that prompts for a file name and then loads it up onto the screen) will all eventually be added. But for now, only the above commands work (and some of them, like EDIT, only BARELY!)

Should I post what I have so far? Are too few interested for that? If so, I'll just mail it to any interested users.

And YES, it will eventually ALL be programmed into Action! and then compiled (if I'd get off my duff and get a good runtime program!), but for now, I'm sticking with TurboBASIC XL, because I know what I'm doing in it! :)

thanx in advance bjk

3945. Action! Question

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-04 01:28:20 UTC
From: jjmcwill@mtu.edu
Message-ID: <1992Oct4.012820.2750@mtu.edu>
Source record: 109241

Okay, perhaps Rick Cortese is the one to help me with this, but I will post it here.

I am working on the functions argc() and argv().

These will be like their C equivalents. argc() will return the number of parameters were passed on the command line when the program was called from a Command line DOS, like SpartaDOS, or DOS XL or OS/A+

argv() will return a pointer to commnad, where if you called the program HELLO.COM, with the following command.

HELLO -a c:path\myfile.dat

argv(1) returns a pointer to "D1:HELLO"
argv(2) returns a pointer to "D1:-a"
argv(3) returns a pointer to "D3:path\myfile.dat"

what I was thinking, is that in the actual code block for argv, all it would have to do is look the BYTE value passed to it, call ZCRNAME that many times, and simply return the address of COMFNAM.
The problem is, I am unsure of the string format action! uses?
Since passing a string to a routine basically passes the pointer to that BYTE ARRAY, I believe that by returning the address of COMFNAM from argv() will be okay, but then I remember reading somewhere that the zeroeth element of a string contains its length. Is this true?
If so, argv() will can move everything in COMFNAM up by one, and insert the length of that into the first location of COMFNAM, but I'd hate to have to fool around with guessing one way or another, if someone on here already knows how to set this up.

I know one reason: Because some of that darn copy-protected junk won't
boot on a XF551 (they spin at different speeds). I replaced my dead 1050
with an XF551, and while not terrible, I wish I had another 1050.

The Digital Editor (PD100)

Reviewed by: Dean Garraghty.

The Digital Editor (PD100 in my catalogue) is a very simple desktop publishing (DTP) package. It is written in Turbo-Basic so is for XL/XE only in 64K. A copy of Turbo is on the disk and boots automatically.

During boot-up you a presented with two opening pages. One details who it is by. It doesn't mention you have to press any key to continue loading, but if you don't it will sit there all day! The second screen is a nice graphics screen (probably created using the package itself) with some nice music. START is pressed to get to the main disk menu.

The package is split into a series of separate programs: Graphics, Photo-Convertor, Editor, 62er-convertor, and Hardcopy 1029.

Graphics

This program is a simple mode 8 graphics creator using a joystick. Press the START key and a menu pops up. This has: Freehand, Lines, Circles, Oval, Fill, Points, Script, Load/Save picture, Mirror, Char set, Directory, Back to Menu.

It works in much the same way as any other drawing program.

Photo-Convertor

In this package a "photo" is a small picture which can be merged into your text (or you text merged around your photo). To create a "photo" file, you use this program. It has options to convert a picture to photo, photo to picture, and page to picture.

The most important is the first of these options. This allows you to load in a picture file created with the Graphics program (or from any other program which outputs mode 8 pictures in the same way), and select an area of the picture to convert into a photo file. This is done by using a joystick. You simply mark the 4 corners of the area to "cut out" and it's done! The photo file can then be used in the Editor program.

Editor

This is the most important program. This is where you create your pages. A page can have both text and graphics (photo files). The text can be 40 cols. normal height, 80 cols. normal, 40 cols. double height, and 80 cols. double.

Pressing SELECT and any key brings up a menu. This has options to: Load page, Save page, Take photo, Directory, Load char set, Return, Main menu, Erase page.

These are all simple to use. When we Take a photo, we can position it at the correct position on the page using a joystick. It's wise to load in your photo first then type the text around it, because the photo positioning is a bit hit and miss. You can only type in text here. You can't load text files in. You can have as many photos on a page as will fit. Also, all control graphics symbols are available. A few have been re-defined as maths symbols.

You are supposed to be allowed to load in new fonts, but I can't seem to be able to get this to work. However, the default font is quite acceptable.

Don't forget that you are designing a page in landscape (i.e. length ways), and it will print out like this too.

The Editor has NO error trapping. If you type something wrong, or make some other mistake it just stops and you get a Basic-generated error message.

62er-Convertor

Some page files may be a strange sector length. If this is so, they won't load into utilities expecting 62 sector format files. This utility will convert your page into a 62 sector file.

Hardcopy 1029

This is a printer dump for the 1029 printer. For US readers, this printer was only sold in the UK and Europe. It's a tacky looking thing which produces awful output using a non-standard pin arrangement.

However, don't dispair! On side 2 of the disk you get two Epson printer dump programs which will dump pages (in 62 sector format) created using the Editor. You can also print it on any utility you have which loads mode 8 62 sector files. I use SEEPIC (PD41 in my catalogue) to print the pages to my XMM801 and the output looks very good.

Other things on the disk

As well as the programs mentioned, you also get a very brief docs file, lots of fonts, and lots of photo files. This is a German program, so the docs have been written (in English) by somebody else and are very brief. Be prepared to spend some time experimenting.

Conclusions and Uses

The Digital Editor is a VERY simple package. But, it does its job as well as can be expected.

I have used this package for professional purposes on a number of occasions. I used it to create the covers for the Digi-Studio manuals. Also, I used it to create some slides for an overhead projector for a seminar I gave at

university on sound sampling. I had a graph along with text around it on one slide, and a bulleted list of key points on another. I also used it to create 10 slides for a group presentation to industry which I was involved in.

To create the slides, I first designed them using the Editor. I converted them to 62 sector format using the 62er-convertor, then printed them to A4 using SEEPIC. They were then photocopied onto a special paper, and finally printed onto film slides.

I recommend The Digital Editor to anybody who wants an inexspensive way to create quite nice looking pages with both text and graphics.

3950. DMS review

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-04 13:21:59 UTC

```
The Digital Music Studio (PD134)
--------------------------------

Reviewed by: Dean Garraghty.

I'm probably not the best of people to review DMS, because I wrote it!
However, I think it is worthwhile knowing a little more about it than the
details given in the PD catatlogue.

I wrote DMS in 1989. The version discussed here is 2.00b. Version 1.75a was
sold up until November 1989 when 2.00b was ready. The two versions are quite
similar, so only 2.00b is in the PD. DMS was originally sold commercially in
the UK and US. However, when I'd completed Digi-Studio, DMS was scrapped. That
was about a year ago now, so I decided to put DMS into the PD.

DMS is a set of programs for manipulating digitized sounds. Programs included
are: main section, compiler, keyboard player and drum player.

With DMS being for the commercial market, it is quite classy in its
appearance. All programs use the console keys for selecting options from a set
of option boxes.

Main section
------------

This program allows you to create and play tunes using digitized sounds. You
can also load in new sounds. You can also load and save tunes. "Tunes" in DMS
is perhaps a bit of an untruth. The "notes" don't play in real musical pitch.
They are just different play rates for the samples. "Notes" are made up of a 4
character code of letters and numbers describing various things about the
"note". A very simple editor is built-in to type in your tune. But, to edit it
you must modify a Basic program. In DMS all tunes are stored as Basic programs
which are just lots of REM statements. You just look for your note and modify
it before saving the program back to disk. A little knowledge of Basic is
advised.

Three samples can be in memory at a time, and your tune can switch between
them as it plays. You can also load in new samples.

The main section also has a utils menu which allows you to delete and rename
files, as well as format disks, and take directories.

From the main section, you can also load in the other programs which make up
the package.

Compiler
--------
```

This program will convert your DMS tunes into a stand-alone Basic program which allows you to play music using digitized sounds in your own programs.

Keyboard player

This program allows you to play music live by using the keyboard. You have your 3 sounds in memory and can switch between them as you play. However, you have to specify how long each note is to play for before starting, so you can't have mixed length notes as you play. You can also load new samples in from the keyboard player.

Drum player

Seven drum sounds are loaded into memory, and you use your keyboard to play them.

What else is included?

As well as the programs mentioned, you also get a very detailed manual. This is ready for printing to an 80col. printer straight from DOS. You also get a load of sound samples.

Comments

DMS is a very classy package, because it was intended for the commercial market. The manual is more than adequate, and quite detailed in parts.

Editing tunes is a pain, and the lack of real pitch makes DMS unsuitable for more professional work.

DMS is great for a bit of fun, or if you want to get into digitizing. Also, if you are unsure abouting buying Digi-Studio, try DMS first. Although Digi-Studio is quite different and much more advanced, it was based pretty much on DMS.

3951. High Scores

This advert is to everyone who can use a joystick.

As you might have seen in issue 52 of N.A.U. I'm compiling a Hi-Scores list for all ATARI 8-Bit games, all I need are some scores from you. So write down a list of all your games (or just your favourites if you have a lot), and go through each of them playing the game a couple of times, then record your highest score next to the title. Once you've done that, send the list to me at...

James Haworth
86 Ashtree Rd
Oadby
Leicester
LE2 5TD
ENGLAND

Then I'll send you a fully compiled list for each of the five top scores for each game...

Here are some scores to work at:

ZYBEX - 159,450

PACMAN - 236,000

NINJA - 16,120

H.E.R.O. - 104,595

DEFENDER - 10,020,750

PITFALL II - 342,134

FEUD -100% VICTORIOS

STAR R'DRS II - 729,200

ENCOUNTER - 74,000

MIRAX FORCE - 102,420

RESCUE ON FRA - 373,539

GALAXIAN - 24,080

I.K. - 75,600

ARKANIOD - 406,630

ALLEY CAT - 236,386

WARHAWK - 222,202

CAVERNIA - 13,910

STACK-UP - 46,200

MISSION SHARK - 37,170

DRACONUS - 10,700

YOGI'S GR. ESC- 207,000

RUFF'N'REDDY - 16,470

CULTIVATION - 4,761

HAWKQUEST - 40,230

So if you can beat any of those scores, or have any you would like to send in, then don't hesitate!!

I also have more scores so get killing your joysticks !!!!!!!!!

That's all for now. Hope you can help me.

JAMES HAWORTH. (14)

3952. Magazine review

Some rumblings about an old magazine I bought

By Dean Garraghty.

I recently bought some old issues of Page 6 to help complete my collection. Along with them came an issue of an American magazine I'd never heard of called "Hi-Res". The issue I had was issue 3, dated March 1984.

Reading through it was like entering a great time-warp! It was published at a time when Atari 8-bits were still very much alive. The articles were very good, and the adverts were interesting! Here's what I found:

The issue had reviews on Preppie! II, Chess 7.0, Flip Flop, Bandits, B.C's quest for tyres, The Dark Crystal, and Rally Speedway. The thing that struck me the most was the prices. $34.95 for Preppie on tape! $69.95 for Chess, which looked awful from the screen shot given. I've never heard of "Bandits" from Sirius Software at $34.95. One thing I noticed about them all, is that the reviewers were very favourable to them. They tended to just point out the good points. This was often the case back then. The advertisers took out big ads for each game, so the last thing the magazine would want to do is tell you not to buy them!

That brings me on to the adverts. As I've just mentioned, publishers took whole colour pages for just one game. This is something we're not used to in the UK. Either ads are cheaper in the US, or the publishers had big ad budgets! Atari had several game ads of their own but for 2600 games. Joust, Moon Patrol, and Battlezone featured in separate ads. First Star was advertising two games in its ad: Astro Chase, and Flip Flop. Sierra on line had a full page for B.C.'s quest for tyres. Adventure International had a page for Rally Speedway. Datasoft had a page for Zaxxon. A company called PMI was advertising 3 games which I've never heard of: Sword Point, Karmic Caverns, and Wampyr's Tomb. No idea what happened to the games or the company. Datamost had a double full colour page headed "Hear at last. Games with real music for your Atari". They were telling you how wonderful the music was in The Tail of Beta Lyrae, Cosmic Tunnels, Mr. Robot and his Factory, Monster Smash, and Cohen's Tower. OSS had a page for Action! headed "Craftsmen need precision tools... Programmers! Demand Precision Software!". This was under a photo of a man making a violin. $99 was the asking price. One other double page spread was from Atari advertising the then new 600XL and 800XL. The ad featured a photo of Alan Alda, under which said "Computer enthusiast Alan Alda uses the Atari 800XL computer system. Alda reports: 'It's going all the time!'". I must say that the pictures of the computers didn't look too convincing. They looked very much like drawings rather than photos. That's got all the "big boys" out of the way. The really interesting stuff was in the smaller ads.

An ad which caught my eye was from Compu-Tech. They were advertising a device called Spider Pac. This was a power pack for the Atari with 4 outlets on the front. These could then be connected to 4 devices without the need for separate power packs. It wasn't cheap at $135 but a good idea.

A company called Tel-Link had the "PiggyProm" board. This held 7 EPROMS. Basically it allowed you to keep 7 programs permanently in the computer so you didn't have to keep putting carts in. Another good idea, but it was only for the 800.

Radical Systems had an EPROM burner and some software as well.

Computer Palace had a page ad advertising various products. Monkey Wrench 2 was there at $45. Flight Sim II was available at $44.90. A Koala pad could be bought for $87. Some interesting sounding disk drives were available. The Astra 1620 at $529, Micromainframe at $499, Rana 1000 at $349, and Trak A2-D2 at $398. Also the ATR-8000 expansion unit was listed. This could run CP/M, had a parallel printer port, printer spooler, serial port and disk drive controller. It wasn't cheap! The 16K model was $299, the 64K model (for CP/M) was $499, and 2 drives for it were $695.

Computer Software Services had some interesting sounding products. The "Pill" at $70 would copy carts to disk. The "protector" at $50 would create bad sectors to protect your disks. The "Silencer" promised to quiten your disk drive down. The "XL fix" was just a translator for the then new XL series. The "Remote" was a device which allowed you to turn your computer on and off from the front rather than the back of the computer. $20 for some wire and a switch, bit expensive!

Computer Creations had most Atari equipment listed along with others and software. What interested me is that they list the 1400XL and 1450XLD. We all know they didn't make it to the shops, but this company seemed to think they did! They also list the "Atari CP/M module". No idea what this was. They too listed those interesting sounding disk drives. What made me laugh about this ad was the prices of blank disks. $21 for 10! You can get 100 for that now!

Superware was advertising their XBASIC. For $30 this program would add 30 new functions to Basic.

Starbound software had two shuttle simulators.

Convologic had the Bytewriter. This looked like a flashy EPROM burner fo $189. They also had the Examiner. This converted carts to disk. They also had the 1850 expansion unit. This had one parallel and one serial interface.

Looking on the back cover of the magazine I find another ad from Sierra on line. This is advertising their "Homeword" word processor. This had a visual menu and a split screen with a full layout view of the page at the bottom. The ad said it was coming for the Atari soon. I've never heard of it. Did it ever make it on the Atari? (I've since found out it did!)

So, what were the articles like? Well, quite interesting really.

The Family Place talked about educational programs.

The cover story was about club med. Club Med the holiday village teamed up with Atari and put some booths with Atari 800s and drives and monitors in all around the camp. People could then use them freely. In typical American style the article turned out to be one big ad for club med, with just a hint of the original purpose of the article in there!

Music theory drills was an interesting article and program to help you to read sheet music.

The Atari drawing board was a type-in drawing program.

There was an article on character sets, an article on The Witness by Infocom, a full explanation of Atari error messages, Part 1 of a story concering PIA, POKEY, and other chips!, Tick Tack type-in program, an assembly language article, advanced user forum by Russ Wetmore (of Preppie fame), an article on Forth, and Kids section for beginners. There was also a letters page and some previews.

The magazine mentioned that from the next issue it would also cover commodore as well. That probably finished it off! I have no idea what happened to Hi-Res, but I certainly enjoyed reading the copy I have!

3953. Foreign suppliers

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-04 13:25:15 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct4.132515.7783@aber.ac.uk>
Source record: 109250

An article by Brian Walker about his experiences with the new European 8-bit suppliers.

Two foreign firms advertised in the number 56 edition of Page 6 Publishing's New Atari User magazine (June/July 1992). KE-SOFT of Germany and A.N.G. Software of Holland.

A.N.G.were advertising the three back issues of their 8-bit disk 'Mega Magazine' and the latest edition available around 'May/June'. KE-SOFT invited you to send off for their free price list, which I immediately did. It only costs the price of a first class stamp to send a letter from the U.K. to other European Community countries.

From the postmark it seems that my letter took four to five days to reach Germany and the reply eleven days in transit to reach me! Why so long I wonder?

An illustrated brochure arrived which doubled as the order form. All descriptions of the software were in English and prices were in pounds sterling and dollars. Software on offer was a mixture original arcade and puzzle type games but also some P.D. and some older software such as S.S.I.'s War in Russia for four pounds. A bargain! I was tempted and sent off an order.

Since the cost of sending money abroad seems to be so expensive I took a risk and sent cash. In fact a twenty pound note which exactly covered the cost of software and postage and packing. Never ever send coins by post. Besides increasing the cost of postage it is a sure giveaway to any potential thief. It's better to send slightly too much money in notes and maybe ask for a credit off your next order.

Two and a half weeks later a jiffy bag arrived. Again from the postmark it seems that my order was dealt with promptly but the delayed delivery was due to the postal service.

One of the original games, Atomit II, had instructions in German but it was so easy to pick up the gameplay that it wasn't a handicap. War in Russia arrived with original documentation and maps but without the bulky box. Sensible really. So no problems with KE-SOFT.

I also sent off ten pounds cash to Holland for the four issues of Mega Magazine. I sent it off in late May and they still haven't arrived yet two months later. I have sent off a chaser today to see if they received my order.

Postscript:The day after I wrote the above and sent off the chaser my disks arrived! It seems that the delay was due to a combination of 'May/June' becoming 'June/July, a change of address and a break for holidays. So, contact has been established and I will send another order off for software from their

catalogue which came with the disks. By the way A.N.G. stands for 'A New Generation'.

The new address of A.N.G. Software is:

A.N.G.Software
Ridderkerksestraat 60
3114 RK Schiedam
Holland.

KE-SOFT are at:

KE-SOFT
Frankenstrasse 24
6457 Maintal 4
Germany.

3954. The future?

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-04 13:25:39 UTC

Source record: 109245

An article by Brian Walker on his experiences with the 8-bit Atari, and his worries for the future.

It is my tenth anniversary. The tenth anniversary of me owning an Atari computer.

For a ridiculously high price I bought an Atari 800 with 16K and then had to go back to the shop to buy the optional cassette deck when I discovered most programs were on cassette.

I paid so much because I knew I was buying the best, and anyway I was going to 'learn about computers', a requirement for the future. I also wanted to progress, so I upgraded to 32K and then 48K, then bought an 800XL, then a disk drive and then two disk drives.

But by this time the 8-bit Atari market was rapidly contracting and I realized that the future of computing lay somewhere else. So I packed away my 800XL and bought an Atari ST. Luckily I bought a cheap ex-demo model from an electrical store and didn't spend too much money on it before I put it to one side and unpacked my 8-bit.

In common with many people I discovered that much of the software was very expensive, the graphics were pretty and the gameplay was non-existant. Maybe things have changed.

Anyway I could now get an 130XE for a ridiculously LOW price and a cheap printer, which I did. At the same time a lot of software became available which was previously unobtainable in the U.K., or was too expensive.

So, have I learnt a lot about computing? Well, er, no. I soon succumbed to playing games and every time I reached over to pick up my copy of 'Atari Basic:A Self-Teaching Guide' by Albrecht, Finkel and Brown, Star Raiders seemed to be in the way and I've spent the last ten years playing games.

Why don't I progress and buy a Nintendo home arcade machine or whatever? Well, I'm using a word processor to write this and I'm enjoying the experience. I'm now ready to learn about computers and computing, slowly, at my own pace and I want to learn on my Atari 130XE.

I can't learn on a Nintendo, the 16-bit ST and Amiga are too complicated and I don't have access to a PC at work. Anyway, even if I had the money to buy one for home use there seems to be so many varieties I wouldn't know which one to choose.

Hopefully, my Atari is good for a few more years yet but what after that? There will come a time when there are no more spare parts or replacements and

I will have to buy something else. What will it be? Will there be anything else besides low cost games machines and high cost business machines? Whatever it is I bet it isn't an Atari. That will be quite a wrench.

If you have an idea of what might be on offer in a few years time please drop Dean a line. Maybe he could include it in the News-Disk. I would be very interested to read your predictions and I bet a lot of other people would as well.

3955. News Station review

48K disk, Atari 800/XL/XE

Reviewed by Allan J. Palmer

Creative Software

One of the more original non-game software products to appear for the Atari 8-bit range in recent years was Broderbund's Print Shop, which allowed the creative production of greeting cards, signs, banners and the like. Text and graphics were mixed with the art being supplied in the form of icons which were positioned about the page layout. However, even with all its good points, there were still some things which Print Shop did not cater for. Signs, cards, etc created by Print Shop are not saved to disk - once you had printed your masterpiece, that was it, you could not reload it at a later session to tinker with again. Additionally, there was limitation in the fonts used for text - no mixture of upper and lower case, no mixture of fonts (at least not without fiddly printing, repositioning paper then designing and printing again...). If you want to combine lots of text (in various sizes and fonts) with graphics for the production of a newsletter or similar, then Print Shop has its limitations.

DeskTop Publishing become one of the "hot" microcomputer buzz words at the end of the 1980s. News Station from Reeve Software attempts to provide owners of Atari 8-bit computers with that capability. If you want to produce a newsletter, or a document which is primarily text with graphics inserted, then News Station is worth considering.

Overview

News Station is supplied on disk in a simple clear plastic case - basic packaging, no frills. The instructions are probably the weakest part of the package, comprising of 5 single-sided typed pages stapled together with an additional 1 page addendum for the latest version (3.0). The instructions are presented as a series of descriptions of what the various control-key commands do. It is disappointing that the instructions do not include either an example of output from the package, or a tutorial to explain the features. Clarification of some commands could be provided. One immediately noticeable omission is in regard to the loading instructions - you are told to insert the

disk then switch on your computer; you also need to disable BASIC by holding down the Option key if you have built-in BASIC, as on the 130XE. A small point, but it can be irritating.

When the disk boots, the Plate Editor program loads. This is one of the two main programs on the disk, the other being the Press. In order to overcome the memory limitations of a 48K machine, to store and manipulate the data which makes up a full page, News Station works on one-eighth of a page at a time. Each eighth is referred to as a plate, thus the Plate Editor is used to add graphics and text to each plate. When you are satisfied with the content of the plate, it may be saved to disk. When you wish to print a page, use [Escape] to exit from the Plate Editor and automatically load the Press. Basically, the Press displays a directory of plate files on a disk and allows you to specify which plate should appear in which position on the page.

The Plate Editor

The Plate Editor operates in two modes, either Text or Graphics. [Control-T] or [Control-G] toggles between the modes respectively. In text mode, different fonts may be selected. Besides the standard Atari font, the control-character graphics may be selected, or a font may be loaded from disk by the [Control-F] command. There are 6 sample fonts included on the News Station disk. Unfortunately, these are not named or depicted in the instructions; (they are: Computer, Greek, Block, Cursive, Square and HighQuality). Having loaded a font, you activate it for use with the [Control-U] command. Inverse characters may also be used in any font. Character heights and widths may be adjusted by [Control-H] and [Control-W] commands - sizes range from 1 to 8 giving 64 possible combinationsfor each character. Thus, (with a bit of patience) you may mix fonts and character size on a single line. Additional control over text positioning may be achieved by adjusting the spacing between lines, and the movement up or down the plate in scan line increments. In text mode, you are given a screen on which you can type text where you want. Alternatively, the [Control-V] command allows you to load an ASCII text file (created by a word processor) to a plate - however, if the text goes off the right side or the bottom of the plate, then it is not used in the final product.

In Graphics mode, you are able to use 3 types of graphics, namely Print Shop icons, standard 62 sector picture files produced by art software such as MicroPainter or MicroIllustrator, and direct drawings (by joystick or touch tablet). With the range of Print Shop icons available , your graphics work should know no bounds. Icons may be placed on a plate in one of three sizes - the smallest about one-twelfth of a plate, the largest about one-half width. Picture files require a '.PIC' extender. Only the top 5/6 of a picture fits onto a plate (a plate is 52 sectors long when saved to disk). My initial experimentation with the package leads me to believe the best approach is to use Graphics mode on a blank plate and position your graphic images (from whatever source) before switching to Text mode and adding your words around the artwork.

General Points

Plates may be saved to disk with the [Control-S] command, they are reloaded with [Control-R]. To my mind, the disk access commands could be made more user-friendly. There is no facility to get a full directory of a disk in a particular drive. The latest version does include a facility to load plates from either drive 1 or 2, but still only saves to drive 1. If you try to load a plate file from a disk with no plate files, the program locks up and you have to reboot!

If you want to create a banner across two plates, or to flow columns down over the border of two plates, I find the best method is to save your initial plate, then using it as a guide, in type-over mode, add your new text, or graphics.

The Press

When you want to print a complete page, load the Press. This program initially asks you to specify your printer type - printer drivers for Star SG-10, ProWriter, Epson RX80 (Panasonic, Citizen), Epson MX80 (Gemini 10X) and Atari XMM801 are included. Version 3.0 of News Station now includes a further option to allow you to build a custom printer driver which may then be saved to your program disk and subsequently used by the selection of "Other" from the Printer menu. Having selected your printer, you will be prompted to insert a plate data disk into drive 1, when the disk is accessed, the names of the plate files on it are displayed down the left hand side of the screen, with a page grid (divided into eighths) appears on the right hand side. Using the up and down arrow keys and [Return], you may move up and down the list of plate files and select the plate you wish to appear in the next available position on the page grid. You may use the same plate as many times as you like on one page, and obviously, you can save a blank plate from the Plate Editor in order to print blank plates in the Press. As yet, I have not been able to determine if there is a means to change the content of the plate grid if you get part way through and realise you have the wrong plate in the wrong place. When you select the final plate on a page, the program automatically begins the printing process without any pause for user acceptance or confirmation.

Summary

As noted above, there are some rough patches to News Station, primarily in the area of documentation and examples, with perhaps some improvements necessary in user-interface. Like most American software (e.g. Print Shop), the page size created is 11" x 8.5", i.e. not A4 format. This may or may not be a problem for you. The package does provide for a range of creative output, and if you want to create a newsletter, instruction sheet, or some varied combination of text and graphics, then if you have the patience to compose your plates carefully, News Station will certainly satisfy your requirements. In the short time that I have experimented with the package, I have found it to be quite a powerful piece of software for the 8-bit Atari. Obviously the output is not the same as something produced from a ST with Fleet Street Publisher and a laser printer, but what are your needs? If you have a 48K 8-bit Atari, a disk drive and a printer, then News Station may be all you need to embark on DeskTop Publishing.

*** You may have read the letter from Alan Reeve elsewhere on the News-Disk about his no longer supporting the Atari. I suggest you check with Reevesoft if News Station is still available. If not, you'll have to look for 2nd hand copies. ***

3956. News-Disk 7 Editorial

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-04 13:30:27 UTC

Source record: 109252

News-Disk issue 7 Editorial.

By Dean Garraghty.

Welcome to issue 7 of the News-Disk. I'm very pleased to be able to get this issue ready so soon after issue 6.

I have recently received a booking form for the All Micro Show 6. I have already booked an 18ft stand. This year it's on November 14th, at Bingley Hall, Stafford. I have put more details in a separate file on this disk called SHOW.DOC. I don't have any leaflets for the show yet. I will probably be in a position to send them out with issue 8 of the News-Disk.

Yet again, all articles on this issue have been written by me or taken from Z*MAG. I would still like to see your articles. I know that a few people are in the process of writing some. Let's hope we get to see these on issue 8.

Some people need to re-subscribe. If your subscription number ends in /7 then you will need to part with some cash! A subscription form will be enclosed if you need to re-subscribe.

On this issue we have:

PD100REV.DOC - a review of the Digital Editor PD DTP.

PD134REV.DOC - a review of DMS.

MAGREV.DOC - an article by me about an old Atari magazine I bought.

ADVERTS.DOC - the adverts!

AT2PCDOC.DOC - how to transfer Atari W/P files to work with PC W/P packages.

HAPPY701.DOC - a long article on how to read/write PC disks using the Happy 7.01 hard/software, and how to use Lotus 1-2-3 files on the Atari.

COLPRNT.DOC - a good article about colour printing programs for the Atari.

BOOTDIR.BAS - a good program which modifies DOS and re-writes sector 3 of the disk so that a list of programs on the disk are displayed on screen during boot-up.

Development has started on package 2 of Digi-Studio. I hope to have this ready in a few months. For those who haven't yet bought packages 1 and 1.5, the music during boot up of this disk was an extract from View to a Kill played in Pan Pipes.

There should be some new PD disks in the library. Check side 2 of your disk. PD orders have slumped again. Come on folks! Don't forget that any money made from PD sales goes into improving the News-Disk. It usually helps to keep the News-Disk account out of the red! Don't forget I will also exchange your unwanted tapes/disk/carts for PD. Also, if you prefer, I will buy your unwanted software from you. All software offered must be originals with manuals/boxes etc. Send me a list of what you want rid of, and I'll give you offers for it in terms of number of PD disks and cash offered. Also, I exchange PD for PD. If you have any new PD disks which aren't available from Page 6 or BaPAUG, then send them to me!

And now a quick note for non-UK readers, who have downloaded this issue from the archive or other BBSs. I would be very grateful if every reader who falls into this category could send me a card with their name and address on, along with any comments you have about the News-Disk. It is hard for me to get accurate reader numbers. This way I will have a better idea just how many people read the News-Disk. Thanks. The address is:

Dean Garraghty
62 Thomson Ave
Balby
Doncaster
DN4 0NU
ENGLAND

This is also the address for PD enquiries, and Digi-Studio orders. Articles for the News-Disk can also be submitted to this address, Or email to: djg0@aber.ac.uk.

Since the last issue of the PD catalogue, I have had to change PD126 (Fred/M.Shark/Ruberball). Due to problems with the first 2 games, I have had to replace side 1 of this disk with "Mario's Desert World". Side 2 (Rubberball) remains the same. Any customers who bought PD126 may send their disk back to me for a new replacement.

Dean Garraghty.
26 July 1992.

3957. News-Disk 8 Editorial

```
Atari 8-bit News-Disk Issue 8
-----------------------------

Editorial by Dean Garraghty
---------------------------

Well, who'd have thought we'd make it to issue 8?! After issue 1 went out in
March 1991, I was doubtful another issue would ever be produced. It hasn't
been easy. People still don't want to share their work with other News-Disk
readers. I am very grateful to those people who have, including Brian Walker
on this issue. BUT! I would definately like to see more original material on
the News-Disk. This issue is largely dominated by old Z*MAG articles. Writing
an article is not as difficult as you may think. If I can do it - anyone can!
Choose an Atari-related subject which interests you, and write a few words
about it. Or, how about a review of some software you bought, or some PD, or a
particular piece of hardware you enjoy using. It doesn't matter if reviews of
the same software have been published elsewhere. Another user's perspective is
always useful. Although I try to keep the articles on the News-Disk at a high
standard, I don't refuse any articles. I may edit them to bring them up to
scratch, but that's all. Have a go. Please!

For most of the UK disk subscribers, it's time to re-subscribe again! If you
fit into this category, a subscription form will be enclosed with your disk.
Please please re-subscribe. Re-subscription time is always a nervous time!
Will they want to re-subscribe I always ask myself. I very much hope the
current 8 issues will inspire you to send your 4pounds for a new subscription!
Don't forget - the cost of a subscription has been the same for 18 months,
despite postal increases, disk price increases, etc. Don't delay -
re-subscribe today!

Now on to the show (AMS6). This is probably the last issue of the News-Disk
until after the show. Please come to the show if you can! We need you there! I
would be very grateful if you could let me know if you intend to come along. I
need numbers you see! The incentive to do this is a 10% discount on everything
available on the day on my stand. Please write and let me know you're coming,
and I'll send you a 10% discount card by return. Hope to see you ALL there!
Don't forget - Saturday 14th November 1992. Bingley Hall, Stafford. 10am to
4pm. All disk subscribers should have received a show leaflet with their disk.
We will have the PD library there, new and used software, maybe some hardware,
and hopefully the new package of Digi-Studio. We will hopefully be
demonstrating Digi-Studio with some live music! Just in case you were
wondering, the music played while booting this disk was "In an English country
garden" played in a heavy guitar!

Now on to a note about disk densities. I recently received a 7 1/2 page
complaint about this subject. I have been accused of confusing people, and
```

talking bullshit. I find this grossly insulting. The whole arguement is over my descriptions in the PD catalogue. As you know, I catagorize disks as SD and DD. I say SD works on any drive, but DD needs a 1050. But, DD is sometimes used to describe true DD disks (180K format) which is used by US doubler and Happy. The standard 1050 density is often reffered to as enhanced density or medium density. The reason I don't use this, is because I find these descriptions totally stupid. There is absolutely no such format as medium density. When I order disks, I don't ask for DS/medium density. There is no such thing. If I stick to two simple formats: single and double, we can avoid confusion. If I start introducing new formats now we are only going to get confused. In the whole PD library I only have 2 disks which need a Happy/US doubler 1050 to run, and those disks say that in the catalogue. Most PD comes on SD disks anyway. Very very few PD disks (or any other disks for that matter) need a modified 1050 to run. Introducing a new density just to take care of these few disks can only cause confusion. I hope you will understand! I know I'm going to get a lot of nasty responses to this, because it is a tender subject for many Atari verterans. But, please, no 7 1/2 page letters!

I think people may not have realized last issue that the new PD I mentioned is listed in a new file called PDLIST.P3. PDLIST.P2 was getting too big! Also, thanks to Johnny Chan, I've been informed that the files are too big to fit into Mini Office 2. Sorry about this. They were designed to fit into AtariWriter, or to be printed out using the program supplied. There are 11 new PD disks available this issue, so check PDLIST.P3 for details! I have also have a couple of new items of used software. As I always say, the PD library supports the News-Disk, so keep those orders coming! Don't forget - I exchange PD disks for your unwanted commercial stuff.

A quick note about Atari Classics magazine. The last I heard, they were working out the fine details with the publisher. It is hoped the premier issue will be available later this year.

I've thought of a new series for the News-Disk. How about a questions and answers page? If you have questions to ask, then send them to me for inclusion on the News-Disk. Then, hopefully, people will be able to send answers for inclusion on the next issue. There is a file on this issue called QUESTION.DOC with some questions from Brian Walker. Let's see if anyone can help.

There is a for sale ad in the ADVERTS.DOC file. Go check it out!

It will soon be time for me to head back to university again. Here is my university address for the coming year: 23 Ystwyth Close, Penparcau, Aberystwyth, SY23 3RU, WALES,UK. Yup, that's right, same as last year! And the dates I'll be there are as follows: 28 Sep 1992 to 11 Dec 1992, 11 Jan 1993 to 26 Mar 1993, 27 Apr 1993 to 23 Jun 1993. This last date will probably change. I'll be at my home address at all other times. You can send orders, submissions, etc to me in Wales direct when I'm there. Or, if all that's too complicated then just send stuff to my home address! Expect a delay though. My home address is: 62 Thomson Ave, Balby, Doncaster, DN4 0NU, ENGLAND. It's not too vital now that you get letters to the right address at the right time. It just involves a delay if you get it wrong!

The articles on this issue are:

ERR164.DOC - what to do if you get an error 164.

FOREIGN.DOC - details and experiences with those new German and Dutch suppliers.

FUTURE.DOC - Atari past and present. What next?

MODEMS.DOC - how to solve line noise, and some common myths about modems.

PROJECT1.DOC - full details of how to build a light sensor.

QUESTION.DOC - the new questions and answers page.

EBURN.DOC - a review of CSS's Super E-burner EPROM burner.

AUTORUN.DOC - an article about using AUTORUN.SYS files.

ADVERTS.DOC - the adverts!

TRIAL.COM - Trial By Fire. We haven't had a game on the News-Disk for a while, so I thought I'd put one on this issue. You have to move the stretcher to bounce the cat-like thing into the ambulance. Most odd!

SDMP1020.BAS - a screen dump for the 1020 plotter.

Please note: I've had to remove DUP.SYS on this issue to fit everything on!

See you all at the show!!

Dean Garraghty
7 September 1992.

Hi Jim!!! Glad to see that your still in the word of the Atari 8-bit. You are surely missed in this area!!

Well, once upon a time when ICD was more than willing to provide information, I wrote to them and asked them for info on the differences in SpartaDOS X. What was sent to me was a leaflet that is three pages in length that has information on the differences in versions from 4.18 to 4.20,, plus instructions on how to replace the ROM. I just don't have the time online left to post this today, but I will post all of the differences between the three versions listed (4.18, 4.19, 4.2).
There are 7 modifications for 4.20.

What Textpro does, essentially, is to poke characters into screen memory instead of "printing" them. Of course, this is one reason why Textpro doesn't work on an XEP-80, but then neither does any other word processor that wasn't written especially for it.

Message-ID: <9210050020.AA26964@beethoven>
Source record: 109256

To hook up a null modem cable between an atari and an IBM is a generic pre-made cable okay to use or do you have to build one? I am using the P:R: port R2: for this so I have the pinout for it in the manual but what would be the pin configuration for the IBM serial 9 pin port?

I hope that you can just use commercial cables as I am tired of building the things. I got my P:R: to work with both the modem and the printer by building cables so thanks to all who replied with help or ideas on the subject....

I think that it would be a whole lot easier to d/l arc'ed files to my clone then null modem them to the atari since the clone can save to hard disk and also has a faster modem... I know Bobterm supports 9600 baud rate. Anyone try this between the two successfully???

Sam

Jeez..if I finish this program tonight, it will have only taken me two days! :)

Ok...here's the deal. I'm working on a program called AACode (Atari to Atari Code.. hmmm...sounds like UUen/decode, eh? Well that it is...) It's NOT a UUen/decoder... it can NOT handle (at this point) UUencoded files nor produce UUencoded files. It does, however, encode files for ASCII transmition (in it's own warped way :))..

When you look at a file (like a BASIC LISTING), you'll notice it looks almost exactly how it should, except some lines have extra characters floating about in them. Here's the deal...

so far, the program can take a LISTing (binaries I'll work on once I've perfected the ATASCII-ASCII encoding...) or 255 char/line or less text file and produce a 35-39 or 75-79 char/line text file (in ASCII only) (but using 155's for [CR]'s..., just use a CR/LF translating terminal program) that, once decoded, will (if I'm lucky) be identical to the original. The program handles the lines like this (for text/listings):

It reads the line (using an INPUT, hence the 255 char/line or less limit) and checks every character of it. If the values of the characters are between 32 and 127, then that line is OK, and it's sent. If the line is more than 35 or 75 characters, then the line is split up into however many smaller lines it takes (up to 8 (255/7 = 7.something).

If the line contains characters between 0 and 32 or 128 and 255, then they have the 128 subtracted (if there) and the 32 added (if it was below 32). This gets done to three consecutive lines, and the +127/-32's of each byte get added to a 4th byte, (which is of course kept within ASCII limits, itself), so when you see the line, it looks pretty normal, except 4/3rds the size. If the line was this: (inverse is underlined)

```
10 PRINT "HELLO MOM!"
----
```

the result would be:

```
10 PRI NT "HE LLO MO4M!"*
```

The "4" and "*" designate that one or more of the three characters preceding it are non-ASCII, and after breaking down the bits of the "4", you'd know what characters had values over 127 or below 32.

Hopefully with this program, we'll see more simple (or complex!) program LISTings (like that 80x24, etc. Action! program posted previously), which contain ALL legal characters, yet are still fairly easy to decipher

without using software to decode them.

Also, since not EVERY line of EVERY BASIC program will have non-ASCII,
the program sizes are shrunk down, without the expense of loosing
graphics or replacing them with "?CHR$()"'s...

So how's this idea sound? I think it might come in pretty
useful! ---

IBM comp. RS232C pinouts are different....you need to swap some
lines...
A "brilliant" thing to do is go to radio shack and buy some 9pin
connectors and a board and wire the same pins as they are on everything
else..then any cable to anything will work just fine...
in fact...radio shack even has a 25pin jumper box that lets you do just
that.
Andrew

I only have one of those games (pac-man) and doubt I did that good. I would like to add that I've hit scores of 60,000+ on donkey kong. Anybody else have scores that high? The only reason I ask, is that I once read a review of the game, and the guy said he could barely get 30,000. I thought I did pretty good.

So everybody, prove me wrong :)

ryan

p.s. And other scores for other games would be nice as well. So gloat everybody.

I remember in the old days when I liked Donkey Kong I hit around 145,000
before tiring of it. It got boring with the same old screens over and over.

Maybe I should crank that game up again.... Haven't even seen the thing for
years...

3966. Command line DOS

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-05 09:31:36 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct5.093136.6744@aber.ac.uk>
Source record: 109260

I started work on a command line DOS about 4 years ago, but never got around to finishing it. It was written in Atari Basic. It had all the usual commands, as well as help <command name> which was going to bring up a help file from the master disk. Another useful command I had was format/b which was a bulk formatter. Bill, you might want to add this to your DOS. After selecting this I had OPTION to quit the formatter, and START to format next disk. Also, after selecting format, a small menu like this would help:

Select format density:

1. SD (88K)
2. DD (MD/ED) (127K)
3. DD (TDD) (180K)

Don't forget ECHO (or have you got this already). Also, I used A: and B: for drive 1 and 2, to remain compatible with MSDOS.

For your next experiment, you should try writing another version but using UNIX commands, for the benefit of us hardened UNIX users!

Dean Garraghty. djg0@aber.ac.uk

You are correct: TextPro, AtariWriter+, and most word processors completely bypass the E: device in order to use their own keyboard handler routines and use custom display lists. Its the only reasonable way to get text to the screen fast enough to keep up with decent typists and do things like word wrap and have the menu lines, etc.

The Atari isn't alone in this regard. With MS-DOS machines, almost all applications write directly to the hardware because the operating system can't keep up with even a slow typist on a 8088 machine.

If you already have an Atari 9pin to 25pin RS-232 cable and PC 9pin to 25pin RS-232 cable, then yes you can simply pickup a null modem adapter from almost any electronics shop. You may also need a gender changer as both your Atari and PC cables will likely have male 25pin ends.

By the way, make sure your null modem adapter supports full handshaking. Some adapters only cross the data lines and disconnect the status lines. This works at slow speeds, but at 9600bps characters will be lost unless the receiving machine can tell the sending machine when to pause periodically.

If anyone is interested, I've got a copy of BBK command processor <somewhere>
It's from an old ANALOG & replaces DUP.SYS and then some. I can't recall all
the details, but I believe it bumps memlo about 2K & remains memory resident
so you can bounce from cart to DOS W/O losing your program if you don't
copy disk or programs.

Hmm, I was wondering about this poking to memory stuff, and if the XEP80 could still display the screen, by having a vertical blank interrupt driven routine that reads the screen data, and then sends it to the XEP80 through E: so that it can be displayed. Of course, the routine would probably have to also make sure that custom display lists are interpreted so that only the text is read, and nothing like those blank lines that some word processors use. I think Textpro separates the command line at the top a black scanline, essentially a graphics 8 line, so a 40 column to XEP80 converter program would have to be able to avoid sending the data for that scanline to the XEP80. A MENU program like FORMAT on the SD-X cart. would be ALOT more difficult to filter and send just the ASCII text to the XEP80 though. (sigh)

This is an edited re-posting of the latest information on Digi-Studio. For more details about Package 2, please mail djg0@aber.ac.uk.

This is the special deal for people in the US who might want Digi-Studio. You can just pay for packages 1 and 1.5 now (which will be mailed straight to you) and get a FREE copy of the new LIDS system when it is avalable. Also, to make it easy for you, I will take payment in cash in US$. The cost will be $25 (which is going to get you everything). Just complete the order coupon and send it to me with $25 to the address given. Please insure your letter at the post office. This costs $3, and if your money goes missing, you will get it back. I can't be held responsible for lost monies if you didn't insure it. Hopefully this new deal with promote a bit more enthusiasm for Digi-Studio in the US. I hope to see YOUR order soon!!

Digi-Studio Information

Digi-Studio is a new piece of software for the Atari XL/XE series.

It allows you to play music using real sounds which have been digitized.

Digi-Studio comes with a keyboard player and tune player. The keyboard player lets you use your computer keyboard like a piano keyboard to play tunes, but using real sounds, rather than computer-generated noises as is usually the case with this type of program. You can have 3 sounds in memory and can quickly change between them while playing tunes.The keyboard player has responsive keys so that the sound will only play for as long as you hold the key down.Just like a synthesizer!! The Digi-Studio disk contains many sounds for use with the keyboard player, ranging from church bells, to pig grunts, to a baby crying, to screams, and lots of synthesizer sounds. In fact around 25 sounds in all. Why buy a synthesizer when your Atari can do the same?!

The tune player allows you to play pre-programmed tunes using any of the available sounds on the disk. Five tunes have been included on the disk for you to play.

Digi-Studio comes on a DS/SD disk, and includes a printed manual. It is aimed at everyone, whether musically inclined or not! You may just want to use it for fun, or compose a tune with it! The comprehensive user manual makes it a joy to use!

Digi-Studio will only work on XL/XE computers with 64K RAM. No extra hardware is required. The sound samples just play through your TV speaker!

Package 1.5 for Digi-Studio is now also available offering more features for Digi-Studio and loads more samples and tunes. This extra pack is available with package 1 only. Check the next section for details of this new package.

Digi-Studio Package 1.5

Digi-Studio Package 1.5 is a new set of programs which form part of the Digi-Studio suite of programs and utilities. It is NOT an upgrade to package 1. It is intended to be used in conjunction with package 1.

Package 1.5 contains two new programs for Digi-Studio: The Sample Editor and the Tune Compiler. Also included are 26 new samples and 18 new tunes for use with Digi-Studio.

The Sample Editor allows you to edit existing Digi-Studio samples, and also allows you to create your own by using a joystick. The Sample Editor has facilities for reversing samples (playing them backwards), copying pages of sample to other pages of sample, and also contains facilities to edit samples very accurately using a joystick. This edit facility also allows you to create your own samples. By using all the supplied facilities, you can create some very weird sounds! You can then save your samples to disk and use them in the Keyboard and Tune Players in package 1.

The Tune Compiler creates stand-alone Basic program modules for including Digi-Studio tunes in your own Basic programs. The resulting modules are output in LIST format for merging into your own Atari Basic or Turbo-Basic programs. The modules are self-contained and do not require any Digi-Studio program to play. Just imagine your game starting with a chorus of God Save the Queen in pig grunts, church bells, electric guitar, ..., or your own sounds created using the Sample Editor!

Also included on the disk are 26 new samples, including pan pipes, various guitars, dog woof, organs, synth sounds, and lots of effects! Also, 18 new tunes are supplied for playing with the Tune Player, or for compiling using the Tune Compiler. These include: Yesterday, Hey Jude, View to a Kill, God Save the Queen, Happy Birthday, This Old Man, and many classics.

The manual is in A5 booklet format, and has been typeset using LaTeX, and printed using an Agfa Laser printer. The clear instructions make the software a joy to use!

THIS IS THE NEW DEAL: BUY PACKAGES 1 AND 1.5 NOW FOR US$25, AND GET A *FREE* COPY OF PACKAGE 2 (TUNE CREATION SYSTEM) WHEN IT IS READY. YOU MAY NOW PAY IN CASH. JUST COMPLETE THE FORM BELOW, AND SEND IT WITH $25 TO THE ADDRESS SHOWN. PLEASE INSURE YOUR LETTER IF YOU ARE USING CASH (THIS COSTS $3 TO DO - ASK AT YOUR POST OFFICE). ORDERS CAN ALSO BE PAID FOR IN OTHER CURRENCIES. PLEASE CONTACT ME BY EMAIL FIRST FOR A QUOTE.

-----CUT-----
Please send me:
PACKAGES 1 AND 1.5 NOW, AND 2 WHEN IT'S READY
I ENCLOSE US$25 IN CASH

On a vaguely related subject, does anyone know what happened to the
BBK guys (Bryan Schappel and Barry Kolbe)? Those guys were incredible.
Over the course of a few years they wrote a...

machine language monitor/debugger
flat-file database
full-fledged paint program
full-fledged spreadsheet
at least two arcade games, one with an associated construction set
text editor

plus some other major programs I'm forgetting. And they were all written
entirely in assembly language. Amazing.

The speed for the 1050 should be 288 RPM... +/- 1rpm

for the xf551 it should be 300rpm...
this does not mean the xf551 reads any faster because of this...
there is timing circuitry that makes the drive look like
a 288rpm 1050.

Beat these scores:

ZYBEX - 234350
I also beat the game, but with only 94000 points.

DRACONUS-30500
At that score, I had only obtained the Helix, Eye and Sheild.

Beat THAT! Muhaha!
(no WONDER my joysticks wear out so fast!! ;))

Action! is REALLY bugging me lately. Somebody PuhLEEZE tell me why this set of routines does what it does, and NOT what it was programmed to do!

Essentially, the Procedure MyAssign() is a replacement for the library routine SAssign, but it just seems to mimick it almost exactly! grr!!

The other Procedure, CDForward() is supposed to (for NOW) append the Char Array (string) "NewCD" to the Char Array "Dir" (as well as putting a ":" before the "NewCD"... ie, if "Dir" was "D1", and "NewCD" was "GAMES", then the result would be "Dir" becoming "D1:NewCD"...)

Anyways...here's what I've gotten so far (all of the other routines were left out for space...):

```
-------------------------MY DAMNED ACTION! ROUTINES START HERE----------
|Define
Begin="Do", End="Od",
EndIf="Fi",
EndProc="Return",
Yes="1", No="0", True="0", Max="255"

Module
; Global variables
Char Array Dir(Max)="D1", Cmd(Max),
Found(Max), NewCD(Max)
Byte Pause=[Yes], Echo=[Yes],
Report=[Yes], Data=[No], Ln

Proc MyAssign(Char Array Dest,Source
Byte Start,Stop)
; Replaces SAssign and should work right
Byte Loop
Dest(0)=Stop
For Loop=Start To Stop
Begin
Dest(Loop)=Source(Loop-Start+1)
End
Put(155)
EndProc

Proc CDForwards()
; Jumps into another directory
MyAssign(Dir,":",Dir(0)+1,Dir(0)+1)
MyAssign(Dir,NewCD,Dir(0)+1,Dir(0)+NewCD(0))
EndProc ; CDForwards
```

Thanx in advance. I don't get it! How does one do a

A$(LEN(A$)+1)=B$

in Action!???!?!?!

You would also have to do something with the "soft" carriage returns at the
end of each screen line, versus leaving the "hard" carriage returns at the
end of paragraphs alone. Otherwise you will have a beautiful, tiny 40
column display on the XEP80.

Hmm, Yeah, makes ya wonder why someone would want to display 40 columns
on the XEP80 in the first place. Reality check!...

Message-ID: <67259@cup.portal.com>
Source record: 109282

```
; Global variables
Char Array Dir(Max)="D1", Cmd(Max),
OK, what you just did was tell the
compiler you have a Char Array DIR that
is 255 elements long & it starts at
the address of "D1" string. This is
the equivalent of doing something like
Dir(255)=$6F0. Action! lets you do it
because there are times when you want
to access stuff this way, but what
happens if you fill Dir? It fills up
past $700 & starts to overwrite DOS!
In your case, "D1" only has 3 bytes
total reserved so if you copy anything
to it, it trashes whatever variables
were allocated after the "D1" string.
Found(Max), NewCD(Max)
Proc MyAssign(Char Array Dest,Source
Byte Start,Stop)
Let's see what you got: You declared a
char array DEST is comming, but it
points to DIR.
That's smack dab in the middle of your
variables, so any operation on it will
trash them. Source will come through
OK & the bytes. Didn't figure out what
you did here, but I don't know if you're
passing the right byte values anyway.
Byte Loop
Dest(0)=Stop
For Loop=Start To Stop
Begin
Dest(Loop)=Source(Loop-Start+1)
End
Put(155);PutE() works fine to
EndProc
Proc CDForwards()
; Jumps into another directory
Of course you are doomed by the time
you get here, but seems OK.
MyAssign(Dir,":",Dir(0)+1,Dir(0)+1)
MyAssign(Dir,NewCD,Dir(0)+1,Dir(0)+NewCD(0)) EndProc ; CDForwards
A$(LEN(A$)+1)=B$
IMHO: It looks like you're trying to use
```

PASCAL type keywords, just remember,
PASCAL is a fascist language endorsed
by people with little minds and a
mainframe mentality! Action! is more
like 'C in that it not only allows you
to do something silly, it encourages it!
OK, what you probably meant to do:

```
CHAR ARRAY dir(255), hash(255)
PROC Main()
Scopy(dir,"D1:")
Print("Input append string? ")
InputS(hash)
Sassign(dir,hash,
dir(0)+1,hash(0)+dir(0))
PrintE(dir)
RETURN
```

Hm, then the speed for the xf551 is equal to the default speed on IBM drives. The speed of the 1050 is lower than the 'standard'. I wonder how the program 'UTIL.EXE' works on the IBM PC. In order to read/write Atari true DD disk it has to emulate the speed of a 1050, doesn't it?

Do you think it is possible to read disks written with 288 rpm on drives spinning with around 300 rpm? (Except on the xf551).

Marek Tomczyk asked how UTIL.EXE works on the IBM PC, when the 1050 drive
is slower than the 'standard'.
Good question, but I will _assume_ that this is why UTIL has always
performed better when the disk used in the PC has been formatted by the
1050 and _not_ the PC using UTIL. Once the disk has been properly
formatted, it has no problems.
Just my guess.

Well, yeah, but how does it go about word wrap and paragraph breaks? (ie,
actually GOING TO THE NEXT LINE, rather than putting an inverse [ESC]
onto the screen...?!) It's all so FRUSTRATING! :)

> 3. DD (TDD) (180K)

Well, for ease of programming, and to make this compatible with any DOS
that may come out in the future (I always look ahead! :)), I may simply
have it format standard (single density, and I suppose that'd be double
on a DD drive, I wouldn't know) and then have an extra parameter for the
XIO call.. I forget which format commands are which in AtariDOS &
compatibles (for the 1050), but to do the enhanced density, you'd need a
parameter.

BTW: I'm not using menus or non-keyboard key commands (ie, Console keys,
Help, joysticks, etc.. I do have a SHIFT+CONTROL one in there, to abort
batch files...but that's in the TBXL version). I dunno why I chose to,
but I'm straying away from menus.. (perhaps because if one wanted a menu
interface for MyDOS, one would use MyDOS's DUP!!! :))

>
> Don't forget ECHO (or have you got this already). Also, I used A: and B: for
> drive 1 and 2, to remain compatible with MSDOS.

Well, I have two commands that might do what you mean by echo..no, make
that 3. The first is ECHO ON and ECHO OFF. When you run a batch file,
whatever is being read from the disk is displayed (with the "D1:" or
whatever prompt before it) when ECHO is on. When it's off, you're in the
dark.
The other command is REPORT (ON and OFF). If you were to RENname or COPY
or do pretty much anything to a file that wouldn't by default show
something on the screen (like DIR), you would be informed of it's success
or failure. (ie, typing "REN FILE,NEWNAME" would do it, then report back
with a "File renamed.") With REPORT ON, this stuff is shown. With it
off, it isnt.
And finally, the other command I have is "%". It's pretty much the same
as PRINT in BASIC. I suppose I'll have to eventually get it to support
EOLing (for now it adds it all the time, so you can't do anything
equivalent to "PRINT "HI THERE!";" yet..), but I think that's more or
less what you wanted....

BTW: I'm going to borrow an MSDOS book (ewwww!) tomorrow (or SOON, if my geeky friend will remember to lend it to me!) so I can see if I'm missing any "must have" commands. :)

3996. Current listing of software

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-07 10:15:06 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct7.101506.2165@aber.ac.uk>
Source record: 109292

This is an updated listing of the software I have written which is available at the archive.

Misc 1 - a general collection of programs with games, demos, music, etc. all written by me. This package is loacted in Djg/djgmisc1.arc

Misc 2 - more of the above. Located in Djg/djgmisc2.dcm

Dean's desktop - a small desktop environment written in Turbo-Basic. Has the main section, along with a database, calculator, and its own DOS. Docs included on the disk. Copy of TB also included. Located in Djg/deansdtp.arc

Education 1 - this contains a collection of educational programs, most of which contain software speech. The programs teach small children counting and maths. Doc file included. Located in Djg/education1.dcm

D.M.S. (Digital Music Studio) - a package for creating and using digitized sounds in your own programs. You can also create some simple sounding tunes using various playback rates. This software comes with a main section, tune compiler, keyboard player, and drum player. Also has ready-formatted 80col Doc file for printing from DOS. DMS comes as 2 files. Djg/dms1.dcm contains all the programs and docs and some samples. Djg/dms2.dcm contains a load more samples. DMS was once a commercial piece of software, but is now PD.

Bash-a-drum - this is a full-featured drum sequencer. It comes with a pattern and song editor, keyboard and joystick drum player. The 8 drum sounds are of high quality. Big doc file included. Located in bashdrum.arc (main directory).

Journey into sound demo - a HUGE demo of digitized music. The two files for this demo will convert into a double sided, 127K a side (1050 density) disk. Music includes, War of the Worlds, Ghostbusters, and many many more. Located in Demos/journey1.dcm and Demos/journey2.dcm

Megablast demo - a 128K demo (130XE or upgraded 800XL needed) of digitized music. Located in Demos/mblastxe.dcm

Long digitized sound demos 1 - contains 4 edited digitized music demos. These files will convert into a DS/SD disk. Located in Demos/digi1s1.arc and Demos/digi1s2.arc

Long digitized sound demos 2 - 4 more music demos. Located in Demos/digi2s1.arc and Demos/digi2s2.arc

D.S.I.L - a simple command based version of DMS. Located in dsil_s1.dcm and dsil_s2.dcm in the main directory.

Digi-Studio PD demo disk - a disk containing a few bits of music and a few samples so you can listen to what Digi-Studio can do. Some docs about Digi-

Studio are included. These don't mention package 1.5 and 2. An updated version of this disk will be completed soon. Located in Demos/digidemo.arc

Rain comes down demo - just one digitized music demo for any 8-bit. Loacted in Demos/raindemo.arc

PST (Programmer's Speech Tool) - program for adding ready done software speech to your software. Comes with 14 ready done samples, docs, and player code. Loacted in pst.arc in the main directory.

News-Disks - these are the electronic versions of my on-disk newsletter from the UK. 8 issues are on the archive. 1-6 are in Djg directory and 7/8 are currently in New. All are called issueX.arc, where X is the issue number. Issue 6 has a .dcm extender (not an arc file).

PD catalogue - my PD catalogues and list of other services are now available at the archive. This disk will unarc onto a SD disk. The PD catalogue is split into 3 files called PDLIST.P1, .P2, .P3. Also on there is a list of new and used commercial software for sale. Located in New called pdlist2.arc.

3997. Re: 1050 vs XF551

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-07 12:58:18 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.09pa@abcd.Houghton.MI.US>
Source record: 109300

Previous messages noted that the XF551 turns at an industry standard 300RPM while the 1050 turns at a slower 270RPM. Some software actually used the data transmission rate as a form of copy protection, perhaps most notable is SubLogic's Flight Simulator II. The XF551 made up their mind to leave an already weak Atari market.

Someone also indicated that it is possible to adjust the spin speed of Atari disk drives. While I know this is true for the 1050 (a simple turn of a potentiometer), I do not think it is quite as simple on the XF551. Since the XF551 uses a standard 360K half height 5.25 inch double sided, double density drive (the same as the IBM PC), the rotational speed has been fixed at the standard 300 RPM.

The good news out of this is that the XF551 is easier to repair.

I don't know where they are today, but I suspect they will turn up again in
the consumer computer world - probally as shareware authors.

At the time most of their software was written, one was (and as far as I
know still is) a high school teacher, and the other a student in that
school. By now, the student should be finishing his undergraduate college
degree (if he hasn't already).

TBR> there is timing circuitry that makes the drive look like
TBR> a 288rpm 1050.

I have trouble believing the timing circuitry thing. I owned both a 1050
and a XF551. An Atari DOS 2.5 disk always had noticeably faster reads on
the XF551 than on the 1050.

Well, I started to right one in Turbo Basic. I had it working a little bit, but I felt it was only of use to those that had at least 128K, so it would load off of ram disk. Having to load it off of floppy would take to long.

I hacked into the runtime.com file, and replaced the D1:AUTORUN.CTB to D8:GOZCLI.CTB, so it would automatically load my cli off of Ramdisk. I had renamed the runtime.com file to dup.sys, so it was loaded when you typed DOS, and it automatcially loaded the CLI. But I stopped development when I realized it would be of no use to 400/800 users, and those with unexpanded XL/XEs

My version was going to support most of the standard Unix commands, including alias. Maybe I can get up enough gumption to rewrite it in Action!

Later.....

4003. For Sale: Atari 800XL, Atari 400, periphs and 30 games: $75

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-08 02:31:19 UTC
From: ereidell@media.mit.edu
Message-ID: <1992Oct8.023119.16839@news.media.mit.edu>
Source record: 109297
Cross-posted to: comp.sys.atari.8bit,rec.games.video,misc.forsale.computers

Asking $75 for all of the following:

Atari 800XL and power supply
Atari 400 and power supply
2 joysticks (not Atari CX40s, too bad)
Pair of Atari CX30 Paddles
2 (dying) 410 Program Recorders
Compute!'s First book of Atari Graphics
Compute!'s Second book of Atari Graphics
Basic B (CXL4002b)
Basic C (CXL4002c)

Atari game cartridges:
Space Invaders (CXL4008)
Star Raiders (CXL4011)
Missile Command (CXL4012)
Asteroids (CXL4013)
Centipede (CXL4020)
Pac-Man (CXL4022)
Galaxian (CXL4024)
Defender (CXL4025)
Dig Dug (RX8026)
Donkey Kong (RX8031)
Pole Position (RX8034)
Ms. Pac Man (RX8043)

Other game cartridges:
River Raid (Activision) (an EXCELLENT game!)
Buck Rogers Planet of Zoom (Sega)
Frogger (Sega)
Star Trek Strategic Operations Simulator (Sega)
Congo Bongo (Sega)
Gorf (Midway)
Wizard of Wor (Midway)
Submarine Commander (Thorn EMI)
River Rescue (Thorn EMI)
Soccer (Thorn EMI)
Kickback (Thorn EMI)
K-razy Antiks (CBS)
K-razy Shoot-out (CBS)
K-razy Kritters (CBS)
K-star Patrol (CBS)
Boulders and Bombs (CBS)
Nightstrike (TG)

Think of it as two classic computers for $15 and $2 per game cart.

Mmm.....have format/s, format/m, format/d then. I really think a bulk formatter would be a nice touch. Any comments on this anybody?

Have you got the PROMPT command in there to change the prompt? Always good fun this one. PROMPT HELLO would change the prompt to HELLO> insted of the boring A>. Are you doing a direct rip-off of MSDOS, because you will also need to have the dirctory name in the prompt as well, like A:\DIREC> or something similar. Oh, and don't forget the wonderfully useful VER command to print out the version number! Have you got dir/w for a wide listing in? What about dir/p for a paused listing, also dir/w /p for both at the same time.

Also, are you having AUTOEXEC.BAT. My command DOS has a routine to look for this on boot-up, execute it if it's there, or just go to the prompt if it isn't.

If you're writing it in TBXL you'll have the problem of actually loading it. You don't want to be typing RUN"D:DOS" all the time. My solution (well bodge really!) was to create an AUTORUN.SYS file to run the Basic program, and then rename it as DUP.SYS. So, when you type DOS from basic, it runs the DOS! Flashy or what, eh?!

Also, I had a command called WRITEDOS which copied DOS.SYS, DUP.SYS (my bit of M/C to run the basic program), and the Basic DOS program itself to another disk.

The CHKDSK command would also be useful to check the disks for bad sectors and things.

Oh, yeah and there's CLS for clear, and PAUSE to give a "press any key...." prompt and wait.

I also had BLACK and DEFAULT. BLACK just turned the screen black with white chars, and DEFAULT set it back to blue. Just in case people don't like blue! You could then shove BLACK in an AUTOEXEC.BAT file to turn the screen black everytime you ran DOS.

Oh yeah, is your program accepting commands in lower and upper case, or just one of these? I had a small routine to convert everything into lower case before parsing.

If I think of anything else I'll post them here.

Dean Garraghty.

4008. Networking an 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-08 13:39:57 UTC
From: tmkk@uiuc.edu
Message-ID: <Bvt1yM.CFx@news.cso.uiuc.edu>
Source record: 109155

Here's one for you hardware gurus out there:

How tough would it be to rig up an Atari 400/800 with an RS-485 port, either through the SIO connector or a couple of joystick ports?

Here's my plan: I'd like to pull some 8-bits out of retirement and give them a full-time job as terminals for a home automation system. The house would have a central "brain" (an IBM clone) connected to various sensors and actuators via an RS-485 network. The Ataris would also be linked to the house net and would be connected to standard TV sets to serve as remote I/O terminals for the system and possibly also I/O processing stations for the various sensors and actuators. Needless to say, Ataris are ideal for this purpose: they're plentiful, cheap, reliable, well-built, and very user-friendly. Plus they can easily be run entirely from ROM (see below).

Why RS-485? Well, ethernet would be overkill (;-), and Steve Ciarcia's home automation stuff uses an RS-485 net running over twisted pair wiring, so if it works for him, it should work for me, too.

So what do you think? Doable? How tough would it be? Anyone done it before?

OBTW, I plan to write the terminal software and put it into an EPROM, stick it into an old ROM cart, and stick the cart into the Atari's crtridge slot. Voila! Instant turnkey network workstation, with no need for cassette or floppy boots when the machine is shut off or power fails.

I've never burned my own EPROMs before. What kind would I need for the Atari? Is there an EPROM which would be a drop-in replacement for the ROMs used in the typical Atari ROM cart, or would I have to use actual program-once ROMs? Obviously, I'd prefer EPROMS since I can erase them and reprogram them should the terminal software be changed or updated. With normal ROMs I'd have to toss the old ones and buy new ones with each change, which could get quite expensive. :-(

>the char under the cursor, scrolling the screen, takes so long that
>even if you wrote code that made a bunch of assumptions, it still
>wouldn't be much faster.
rts
.end
It was just supposed to be an example! If I was in Action! I would never write a call to do something like that. I'd never encourage anyone else to either. One last time trial<g>. I'd guess between looking up the free page zero locations under MAC/65, DDT, & writting the actual code & translating it to an Action! call with plugging & unplugging carts, it took me about an hour, probably more, to get the thing written. To do the same thing in Action!, it's just:

```
bptr=stuff
WHILE bptr^<>0
DO
PUT(bptr^)
bptr==+1
OD
```

5 lines of code to replace 25 lines of ML & if you want to push it, the way the compiler is written, you could put everything on one line! To be as fair to ML as possible, I only printed 800 char so the screen scroll routines would not be added. Ended up Action! ran at 72% compared to ML. I'd bet it took me less then a minute to type out the Action! routine. Anyway, that's why I'm such an Action! fan. I usually get about 50% to 99% of the equivalent M/L routine without having to worry if I did a BEQ or BNE & it doesn't take me a tenth of the time to code compared to M/L.

At least for the ROMs, I know a little about them. There's the PC
boards were made in different configs to take eveything from 2532's
to 27128's. The path of least resistance would be to find one with
a 28 pin device (Old Galaga carts from Atari were this type). These
will take a standard 2764, no problem. B & C sells cart making
supplies if you don't want to take a cart apart, but they're pricey.
To make something run from a cart, it's pretty much as simple as
either storing the run address at $BFFA or $BFFE.mThe OS does
a JMP($BFFA) to turn control over to the cart. There's a few other
major details, but it's not that bad. IMHO: you may have trouble
finding someone with info on the interface. If you write the code
for a program that runs in the cart address space, burning an EPROM
page
Whoops! only takes a couple of minutes.

4013. "Relax" - EMG box from Synapse software question

Khan,

For all practical purposes, a ROM is a ROM is a ROM, whether is be
a masked ROM, which is a regular rom, or an EPROM, or an EEPROM.
Heck, you could even but a battery backed SRAM in there and the computer
wounldn't know the difference if you did it right. Most atari cartridges
use either 8K or 16K worth of ROMS, depending upon how bin your program
really is. I don't know much about RS485, so I can't tell you whether it
is viable or not. I also don't fool much with SIO myself, but since there are
some SIO to RS232 projects out there, perhaps RS485 is doable.
It might be more feasable on an XL or XE, since the Parallel bus, or even an
internal hack for that matter, allows you to wire in chips directly to
the processor addressing space, and access them directly. You could make
some parallel bus application cards that are plug and play.. in fact
there might be a way to put your ROM code on the Parallel bus card
as well, I will have to check into this when I get access to some
scopes and stuff. This sounds like a great project you are cooking up, please
keep either this net, or me personally, posted on your progress.

I posted here about a month ago complaining that Pastfinder was just impossible. *I WAS WRONG*.

It IS possible to get to the top of the board in Pastfinder. I must have used about 40 lives to do it, though I did manage to deliver 219 "thingies" on my first life. (Brag, brag.)

But the disappointing thing is that *nothing happens*. Well, almost nothing. It shows you where all the hidden "thingy" drop-off points are, and then puts you back at the bottom like usual. (And you get tons of bonus for all the squares you've visited thus far.)

Now what? Anybody know what you're supposed to do? Am I just supposed to keep playing until I visit every square? Do I have to hit all the drop-off points? Did David Lubar just figure no one would ever get to the top anyway? Anybody wanna buy a Pastfinder cartridge? :-)

That box probably connected to the paddle inputs, in which case it would look like a 0-100K variable resistor.

Yes, the 551 can read enhanced density disks, which are simply double density but with 128 bytes per sector and 26 sectors per track. But I've heard it said that the PC can't read this format. Not having a PC, I don't know if it's possible.

Bill Marcum bmarcum@world.std.com

4018. Re: drive RPMs & ability to read/write

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-09 12:43:02 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.09s8@abcd.Houghton.MI.US>
Source record: 109196

The question was how disks are interchangeable when they have been created on a 288RPM drive (810 or 1050) vs a 300RPM drive (XF551)...

The revolutionary speed does not actually have a major impact in this case. The drive controller for both drive types uses the drive speed of its drive to format the disk with a specific number of sectors per track, bits per sector, tracks per disk side and (with the XF551) the number of sides. Once this information is on the disk (low level format), it is used to read/write higher level information (directory structure and data). Disk rotational speed is no longer a consideration (except where used by copy protection schemes).

To read an Atari disk in an IBM drive, it must be double density as the standard disk controller for IBM 360K drives cannot read a sector density lower than 256 bytes per sector.

CF> If it can, then it should be possible to program a PC to read them...

Yes the XF551 can read enhanced density disks, but no you cannot program a
PC with a standard drive controller to read an enhanced density disk.

Enhanced density disks use 128 byte sectors with 1.5 times the "normal"
number of sectors per track. PC drive controllers can only read sectors
with a minimum of 256 bytes per sector (double density). Obviously the
1050 or XF551 in enhanced density mode is writing with a data density
equivalent to double density - this is a rough way to put it, but drive
controllers read bytes per sector not raw data bits.

The U.S. Doubler "reprograms" the 1050 controller to write 256 bytes per
sector (as you gather from above, the drive can write data at this
density).

Such as? I knew about having the run address burned into the special
locations, but I didn't know about the others.

Yes, the PC can read them. All you need is UTIL.EXE to run on your PC.
This is a program to read/write files on a MYDOS format double density
disk. The program is available (and similar ones) at the archive.

Hello everyone,

I have an Atari 800/810 and an IBM PC with a 20Mb hard disk.

SIO2PC sounds like its the cheapest way for me to go to transfer
files off the internet to my Atari (1050 ICD drives are hard to find). The
docs mention that for $50.00 he will build this box for me.

Does the inventor of sio2pc have an email address/or phone # where
he can be reached? It sounds like this will work well, but I'm curious to
see how other people out there like it as well. Please let me know any
info. that you have. Thanks.

Later..

P.S. Any good shareware character set generators out there?

There is a game called "Gremlins" - a friend of mine gave it to me - don't know where he got it. Well, my record on it is 1,976,009 (I *CAN* prove it, I have a photograph of the final score; I did it on feb/1990). You know, there are some games that do not get any more complex after some moment (my previous record was about 80,000) - Gremlins is one of these. BTW, that game lasted for 7 hours and ten minutes (that IS my longest game also - we should record the longest arcade games also...). I began to think of photographing it when I had been playing three hours and my brother did it.

There's other hi score in here... my bro once played JOUST in Skilled level and (same thing... it doesn't get any more complex after some level) he did 10,000,000 points (the score board went back to 0) and then he got bored and threw the game away (he had about 30 extra lives unused). His game lasted for 7:15' - he broke my record only two weeks after I did mine in Gremlins.

Well, from Mapp'n, $BFFC non-zero=>No cart in left slot. $BFFD allow disk boot. I forgot the value you need to allow disk boot. Found out about it the hard way when I burned a SpeedScript cart. Allowing disk boot doesn't hurt anything If there's no drive, just takes a little longer & give you the option IF you want it.

Has anyone out there finished Round 5 in Broderbund's "Drol"? Anyone with
more than 25,000 points? I'm making my own version of the game (for the PC)
and need to know what happens. I've never been able to finish Round 5.
I got close, but when the dragons are spitting 4 bullets each time they shoot,
there's about a million knives, swords, and axes flying, and you can't stay
in the air for more than 2 seconds without getting wasted by the little
saucer thing, it gets a bit difficult. I can't imagine the game getting
any harder after that, but then again, the intermission screen displays the
round number using two digits.

>a masked ROM, which is a regular rom, or an EPROM, or an EEPROM.

As long as they have the same pinout, number of pins, power
requirements, access speeds...

Based on the emailed responses I received, there are some EPROM families
with different pinouts than the ROMs typically found in Atari ROM carts,
which would require modifications to the ROM cart's circuit board. I
wish to avoid this sort of problem at all costs.

>It might be more feasable on an XL or XE, since the Parallel bus, or even an
>internal hack for that matter, allows you to wire in chips directly to
>the processor addressing space, and access them directly.

I agree, however I want to use 400s because a) they're cheapest, and b)
they have those Coke-proof keyboards. Besides, my 800 works, but my
800XL is hosed. :-(

>This sounds like a great project you are cooking up, please
>keep either this net, or me personally, posted on your progress.

You bet! I'm sure I'll need more help as time goes on... ;-)

Unless there's a new version, UTIL.EXE only reads 180K true DOUBLE density disks--NOT ENHANCED density disks. Someone else said that the XF551 can read ENHANCED density disks, so it should be possible to read them on a PC if someone writes the program to do so. Has anyone?

Well, okay, along the lines of the 400, I don't know to much about the internals of it, and if there are any ways to pull the bus out to a board where you could wire in some extra hardware. Let's see, that one only has two joystick ports? Man, I really don't know diddley about the SIO port, but it looks like that may be the way you have to go, but I do seem to remember taking apart an 800 once, just for the heck of it, and wasn't there an extra connector on it or something? Something buried deep inside?
Maybe you could do something funky on a board that plugs into the slots on the 400.. it did have one slot or something didn't it?

Jeff

Ah... but if one were to "speed up" their good old 1050, would it still
read the old disks? (ie, say I had a disk I formatted and wrote to, would
changing the speed make it unreadable??)

Source record: 109176

Well, lets see... the program accpets only uppercase (since it's MyDOS, the filenames can have lowercase in them.. that's why I don't change the Caps of the inputs before I parse them). Also, instead of having a "BLACK" and "DEFAULT" command, one just uses "POKE 709,x", or even "POKEC 709,x" (or was it "POKED") to get both location 709 AND 710 changed..

here's a list of what I've got planned (and most of what I have done in the TBXL version):

(parameters in between "<" and ">" are optional. These are also nested.)
% <text> - display text (or a [RET])
CD <dir> - change directory. With "dir", it will jump into a directory. Without (or if "dir" is "..") it will jump out.
.. - jump to root (change directory to the drive.. ie if you were in "D2:FILES:GAMES:", then ".." would change it to "D2:".. a simple "D2:" would do the trick, but HEY! what if you were in "D1:"!? (this is useful for batch files..))
DIR <dir> - show directory. In TBXL I also had the optional ",to" if the directory spec was made. In Action! I will have output be redirectable.. also, the filename examining part of the parser will determine where to temporarily send the output (ie, something like a ",P:" in a SHOW or DIR command would send to printer rather than the output (normally screen, but hey, it's all settable!!))
MK dir - make directory... simple
DEL file - delete file(s) (if a certain command is appended to it (which I haven't decided on yet), then a "DELETE?" prompt can be turned on.)
LOCK file - lock!
UNLOCK file - hmmm!
REN file,new - rename file(s) (there'll be that prompt command.. so you could use wildcards)
LOAD file - binary load
RUN file - binary run
RUN@ add - run at address (and hey, values can be put in either decimal, hexidecimal or VARIBALE form!! WOW! This thing'll be PROGRAM-MABLE! (at least using batch files...))
Ddrive: - set drive (also works in place of "..")
SHOW file - just like "type" on the IBMs.. it displays (a) file(s)
TYPE file - this is just "COPY E:,file" in disguise (also, if you were to USE "COPY E:,file", the screen would be cleared.. in this case it's kept intact)
COPY file,to - copy file(s) .. will have swapping, copy alphabetically, etc. etc.!!
PAUSE oo - (the "oo" stands for "ON" to turn on, "OFF" to turn off, or

nothing to display current value) This turns screen paging
on & off.. and hey, maybe I'll even have a "PAGE-UP" type of
command...MAYbe
ECHO oo - this is for showing what a batch file is doing to your poor
system...
REPORT oo - this turns off reports like "Directory made" or "Cannot
delete"... or it turns them on.. or if you type it alone, the
last report (whether displayed or not) is shown.
NOISE oo - this is I/O noise- location 65!
CLICK oo - this is keyclick
SPEED val - this sets the key-repeat speed
POKE add<,val> - with a "val", this works like POKE, without one, it
works like PEEK.
DPOKE add<,val> - ok, it was "DPOKE".. it pokes val (which can be from
0-65535) to locations add & add+1 in LSB/MSB format.
? - display help stuff (possibly from a file, maybe not..not fin-
ished yet!)
BAT file - load a batch file (will be nested!)
CLS - clearscreen
EDIT file - load up a file into the handy dandy editor...(yuck)
GET file,add<,size> - load all or part of a file into a block of memory
PUT file,add,size - save a block of memory to file
MODE val - change graphics mode
COMPARE file,to - compares two files (possibly even with SWAPPING!?)
RUN - reset MyNI_DOS
RESET - press the [RESET] key (it does it for you, you lazy bum)
BOOT - turn off & on the power (it calls the routine at $E477
(58487), whereas "RESET" calls $E474 (58484)..try 'em!)
FORMAT <dir> - format drive (any filename will be valid, in case some
DOS of the future supports directory formatting or some-
thing strange like that!)
FIND file - find a file on the system (searching from current drive in-
wards)
TREE <dir> - show directory tree (searching from the current directory or
the one specified in "dir")

That's all I have on this list.. so far, my Action! version can do
these:

? - help
CLS - clearscreen
Dx: - change drive
% <text> - PRINT
CD <..><dir> - Change dir.
.. - jump to root
DIR <dir> - show directory
REPORT oo - report on/off/display
MK dir - make dir.
BAT file - not tested..run a batch file
DEL file - delete
REN file - rename file

LOCK file - lock file
UNLOCK file - unlock file
ECHO oo - batch echoing..not tested
MODE v - graphics mode
NOISE oo - I/O noise
CLICK oo - key click
SPEED v - key repeat speed
DELDIR <dir> - delete all files (if deletable) within a directory and
then delete that directory... it's very buggy, and I may
simply remove it because a "DEL dir:*.*" and "DEL dir"
would be identical..

So.. is that enough, Dean? :) Any other ideas anyone!?!?! :)

thanx for the interest.. and thanks to Rick Cortese and Jeff McWilliams
for the help, and of course to Bob Woolley for giving me Action! in the
first place..
anyone recommend a GOOD, EASY TO USE, PD, runtime pkg!?

thanx!!! bill

4031. New at the archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-10 05:51:03 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1992Oct10.055103.15077@cs.tulane.edu>
Source record: 109173

New at the Atari archive, uue.arc, pabqwk.arc and wdir.arc.

uue.arc
A new set of uuencode & uudecode for the 8bit. You still need to send the files as you would any text file...use bobterm's ascii tranfer or Kermit's kermit tranfer. Testing here at WBUG has shown uue.com to be faster,cleaner and easyer to use than older version of uuencoder/decoders.

PabQwk
PabQwk is the first QWK packet reader for the 8bit. If you have used other BBS networks you have heard about offline reading, now you to can enjoy the option. PabQwk work with most standard QWK packets produced by many IBM and ST boards. WBUG has tested PabQwk with Qmail4 run on a PCBoard and has found it to be an easy to use timesaving program....

Wdir
With all the talk of cli's and what people would like to see, there was talk of wide dir's. here is an example of a wide dir program written in Action! that will work on any of the SpartaDos's. Jon D. Melbo has released this program into freeware and has included source codes... If you program in Action!, you will mostly want to check out the source codes. WBUG has tested Wdir with SDX 4.20 and found it to be quite good, we did add one line to the code, a put($7d) to clear the screen prior to printing the two col dir. If you are using an XEP80, Wdir will output in 4 col's...

I think you're right. Why should there be a timing circuit?
How would it work?
The XF551 still transferes data at 19200 baud, like the good old 1050. I've heared a couple of times that the XF551 is indeed a little faster than the 1050. This gain in speed must result in the fact that the mechanism turns faster. Due to this the sector-interleave stuff is handled more quickly.

>but with 128 bytes per sector and 26 sectors per track. But I've heard it
>said that the PC can't read this format. Not having a PC, I don't know if
>it's possible.

Some time ago a programmer of either UTIL.EXE or SR (another program that allows to access Atari DD disks on the IBM platform) stated that it was possible to read/write disks in the enhanced density (ED) format on a PC. He told sth like he tried it, but he didn't want to continue the hacking. Maybe it was another person I don't remember.

Anyway, before I found UTIL.EXE on the archive I wanted to write a program like this by myself. Then after finding it I stopped the project. Why should I reinvent the wheel? :-)
I believe very much that the IBM PC can read ED disks. In the hardware descriptions of the PC you can find specifications saying that there's a possibility of changing the accessed sector length to 128 bytes. The way the data is stored on the disk is the same in either the DD and ED. Both are written in the MFM mode.
You can't obviously await much help from the (MS-DOS) operating system; you have to go down to the BIOS or even the hardware level.

Does anyone remember a product called Relax for the Atari?
it's an electromyograph that you attach through the joystick port. you wore this headband and could measure your stress level or play games using it. I'd like to find a way to hook it up to a computer with a serial port, but i have no idea what the interface looks like. I assume that it was using the standard joystick interface but i don't know what that looks like either. Would some kind soul send me a description of the interface or point me towards one? thanks for any help.

Many people here have indicated that the XF551 drive causes some havok
to a few copy-protected disks, such as Flight Simulator II by SubLogic.

What deprotection programs are available (so I can use FS-II on my XF551
drive) and where can I get it/them?

If you already built the modem cable you can buy a pre-made null modem cable
with a 25-pin to IBM-PC 9-pin adaptor and attach it to the 25-pin end of the
modem cable (be sure the connectors match of course). Or better yet, find a
25 to 9-pin adaptor that also acts as a null modem connector, thus eliminating
the need for another cable.

>
>I think that it would be a whole lot easier to d/l arc'ed files to my clone

>try this between the two successfully???
>

Yup, using a setup not unlike what I described above. It took a little
tweaking but it worked. The slow Atari drives really pull down the efficiency
of the transfer though!

4041. Re: High Scores

Actually, the Defender high score isn't all that difficult to break, you just need a lot of TIME. Dropzone was a much harder game.

On Star Raiders, I've achieved a Star Commander Class 5 on Warrior level and Star Commander Class 1 on Commander level WITHOUT docking. I also got 1,060,000 on Missile Command, starting from level 8.

Now that I've wasted bandwidth bragging and inflating my ego to humongous proportions, let's hear from other people... 8-)

From: phbill@cyberden.uucp
Message-ID: <1LaisB2w165w@cyberden.uucp>
Source record: 109191

```
; Here's an Action! program I peiced together from bits of my DDIII to
; TrueFont converter. It prompts for a filename (you NEED the "D:"!) and
; proceeds to load that font onto the screen. ONLY single file DDIII
; fonts are allowed.. DDII fonts (like "TIMES" and "SCRIPT2") can't be
; loaded until they're saved with DDIII's font editor, which converts
; them (I THINK).
;
; If there's not enough space on the screen to load the font, the screen
; is scrolled. The Procedure MyPlot isn't very efficient, so I turn off
; the screen during load/display, and turn it on for a split second
; before it starts loading the next letter. It works really nice, and
; once I perfect my Outliner, everyone'll be able to ROTATE and ENLARGE
; DDIII letters... and eventually be able to use TrueFont: Print! to
; print out nifty documents!
;
; TF:Print! is not going to happen soon, but TF:Outline and TF:FontMan!
; (the editor) should be out soon.. (possibly even before Crashman!,
; because it's been put on the back burner.. I'm in the mood for
; applications lately ;) ...

What's wrong with your ROM? I don't think ROMs die so easily.
Maybe it's just a cold solder?

> Of course, I don't read one bit of German, how hard do you think it would be

> Just getting a free copy of Quick! would be enough in return for me editing
> the English version of the manual. What do you think?

It wouldn't be too difficult to translate the manual.
I could do a rough translation, no problem. Your idea sounds very
good for me. I don't know what PPP would think about it.
I guess I write a note with a query.

BTW: Some days ago one of the programmers of Quick, Harald Schoenfeld,
got back on me. He wants to make Quick available in the US soon.
He've heared about the problems with Bills copy on his 1200XL.
Before he's going to release Quick in the US Harald Schoenfeld
wants to know if it will work on US Atari 8bit computers.
To check this, there's a file called 'rubberba.arc' on the
atari.archive.umich.edu in the main 8bit directory.
It contains a demo version of a commercial game programmed in Quick.
Could you or anybody test the game on your system.
Harald Schoenfeld would like to have as much feedback as possible
from owners of different computer types i.e. 130XE, 65XE, 800.

He is realtively new on the net. I've explained to him how to
contribute to c.s.a.8. Who knows, maybe he'll explain Quick
by himself in near future.

Jeff, I guess I pass your proposal directly to Harald Schoenfeld.
Let's see what he's gonn say about all this.

Hmmmm...haven't heard of the RS-485 net...do you have specs?

As far as how to connect...I'll mention again that a group of us on GEnie (called AGDA) are developing a game that uses up to eight systems connected via the serial bus (SIO). This seems to work and would be relatively simple to adapt to a network (assuming that the RS-485 standard isn't too exotic). I don't know how far you can string the signals before they get too degraded to work, though. But I can probably advise you on using the serial bus as a means of interfacing.

|> OBTW, I plan to write the terminal software and put it into an EPROM,
|> stick it into an old ROM cart, and stick the cart into the Atari's

I know CSS still offers an EPROM burner. UV-erasable EPROMs are readily available, and you could probably purchase old carts to use as raw materials for all other hardware (some old Atari carts were once considered for use as landfill).

BTW, anyone here interested in receiving a demo version of the "Maze of Agdagon" game I mentioned?

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-13 03:39:55 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <Bw1JIK.9tA@mentor.cc.purdue.edu>
Source record: 109195

For Sale: Happy 1050 with Happy Controller Option and
Version 7.1 Software.

The Happy option will allow you to make copies
of about ANY 8-bit software ever made and be able
to read and write in single density, enhanced density,
and true double density with much FASTER disk access
than normal, although normal speed can be selected.
This is GREAT for backing up your collections of older 8-bit
software that you are concerned about losing!!

Price: $160.00 plus shipping.

The Happy Controller is a professionally installed
option that allows switch selection of regular speed
or Happy speed disk I/O. There is also a three position
switch that allows:
1) Writing regardless of write protect notch.
2) Normal Position
3) Write not allowed under any circumstances.
There is also a yellow light between the new switches
that is lit if writing is allowed.

The Version 7.1 software comes with Warp Speed DOS,
a sector copier, a Happy backup program, and diagnostic
and utility programs.

If interested, please e-mail to lenn@mentor.cc.purdue.edu
or lennjm@sage.cc.purdue.edu

This drive is in PERFECT condition. I have treated it with
the utmost in care.

Thanks,
Jody Lenn

Don't have your manual yet? Don't be
suprised if when you get it, you still
can't figure things out <g>. It has to
be the worst manual ever written.
1. How do you access individual
elements of a CHAR ARRAY? Just a few
oddball notes. I don't believe Action
treats CHAR any dif then BYTE, this is
inconsistant with the 'C language where
a char is positive if it's 0-127,
negative if it's 128-255, so allow for
that when you program. Anyway, you
normally just declare
Char ARRAY buffer(200)
then access it just like you would an
array in BASIC, i.e.
buffer(0)=>first element
buffer(10)=>tenth element etc.
You can also declare arrays and specify
an address:
BYTE ARRAY colreg=708
then access them with statements like:
colreg(0)=33
colreg(1)=222
This is really common in Action, no more
having to remember the horizontal
postion reg of players, just tell Action
the starting address of whatever you
need, then use the right number. I've
heard this and pointers are the fastest
way to do things in Action since it
doesn't require a JSR to a PROC.
2. What are the different variable
types?
BYTE=>0 to 255
CHAR=>same as a BYTE
INT=>-32768 to 32767
CARD=>0 to 65535
and arrays of all the types, but what
you probably want to know is a CHAR
ARRAY equivalent to a String? NO! Arrays
are general purpose while any string in
Action is 0-255 bytes long with the 1st
byte the string length. You can easily

make a CHAR array look like a String
though. Just copy the entire string
including it's length into the array,
then you can PRINTE(<array?>). You can
also declare RECORDs & use the '.
operator to access the individual
elements, but this is mainly used for
database type app's. The example in the
manual is good.
How would you do the following in
Action!
If name$="Test" then .....
BYTE ARRAY str1="Hello", str2="Hello"
int result
PROC Main()
IF SCompare(str1,str2)=0
THEN PrintE("They're eqqual")
ELSEIF SCompare(str1,str2)<0
THEN PrintE("str1<str2")
ELSEIF SCompare(str1,str2)>0
THEN PrintE("str1>str2")
FI
or you can just
result=SCompare(str1,str2)
IMHO: Action is better then BASIC for
this since it returns a +- or 0 value,
you can sort things easily.
I can't figure out how to do comparisons
with CHAR ARRAY.
I don't know if you really mean this.
Action has no built in function to
compare ARRAYs unless you make the ARRAY
equivalent to a string & <255 bytes.
4. Is there any sort of INSTR command,
like the one in TurboBasic?
Don't know what INSTR does, but if you
mean search a string for a substring,
there's one on page 138 of the manual.
It's about a 15 line procedure.
5. Can anyone give me a list of CHAR
ARRAY procedures? (Like real
definitions to Scopy() Sassign(), and
whatever else you can think.)
From the manual, equiv statements:

BASIC Action!
B$=S$ Scopy(str1,str2)
you can also use stuff like
Scopy(str1,"Hello")
Scopy(buffer,str2)

B$(3,5)=S$ SAssign(str1,str2,3,5)
B$=S$(3,5) ScopyS(str1,str2,3,5)

6. Is there anyway to make the left margin in column 0 in the editor? Easy, from the monitor hit O<RETURN> to get to the options menu, make sure you also disable that !@#$ bell too. You can use the set directive in the editor if you like, just have the first line of your program: SET 82=0 and it'll set it every time you compile. You can also e(X)ecute an Action! command from the monitor: X POKE(82,0)<RETURN>

4052. High Scores

>highest score next to the title. Once you've done that, send the
>list to me at: [stuff deleted]
>From Dean Garraghty

Couldn't we just send the High Scores to you Dean via email?
My hi-score for Pacman is 364150, I started on the 'key' level and managed
to reach the 32nd level from there!

4053. A few more Action! questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-13 20:17:37 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Oct13.151737.13523@miavx1.acs.muohio.edu>
Source record: 109105

1. How do you access individual elements of a CHAR ARRAY?

2. What are the different variable types? (Difference between BYTE, CARD, CHAR ARRAY, etc)

3. How would you do the following in Action!?

If name$="Test" then .....

I can't figure out how to do comparisons with CHAR ARRAY.

4. Is there any sort of INSTR command, like the one in TurboBasic?

5. Can anyone give me a list of CHAR ARRAY procedures? (Like real definitions to Scopy() Sassign(), and whatever else you can think.)

6. Is there anyway to make the left margin in column 0 in the editor?

7. Any other commands in the editor or compiler that are not that easy to figure out?

I've only used Action! a little bit, but I like it a lot, I doubt I will ever go back to Basic!!!!

Thanks a lot!!!

Later.....

********** A T A R I C L A S S I C S **********

ETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BUL

ATARI CLASSICS has arrived. Following a week of anxiety in which our printer didn't quite make the original shipping schedule, at the last moment Pattie Rayl managed to save the day by having the printer ship the magazines directly to the hotel in Reston, Virginia via 2-day air. They arrived in the nick of time, the day before the WAACE AtariFest began.

I think the magazine looks GREAT. On the front cover, the unique AC logo is separated from a big Fuji symbol by a heavy black bar that says it all:

"The Magazine For The Dedicated 8-Bit User"

About 350 copies were on hand for distribution at the Fest. I ended up bring-ing home about 40 of those, all the rest went into the hands of potential subscribers. I spent the whole weekend hawking AC from the Unicorn Publications booth in the main vendor area. About 150 subscription for subscribers. This might not sound like much, but even the larger magazines like AIM or CN would consider this an average figure. Considering this Fest was 93% ST, AC did very well for itself.

At the present time we are still working on AC's subscriber database, which we will use to prepare all the mailing labels for the remaining copies of AC that are now languishing at our printer's mailing facility. The mass mailing of the FREE Premier Issue is expected to commence the first week of November.

If you have already sent us your mailing address, or if you participated in the Mail Campaign earlier this year, all you have to do is watch your mailbox. If you haven't yet sent us your name but would like to receive the free copy of the Premier Issue, send your postal mailing address to:

ATARI CLASSICS
179 Sproul Rd./Rt. 352
Frazer, PA 19355
ATTN: B. Poehland, Mging. Ed.

Of the 2000 copies of the Premier Issue that were printed, I estimate we have maybe 400 copies that are not yet spoken for.

The Premier Issue contains a subscription form. If you like the magazine, snip out the form (or xerox it), fill it out, & send it in with your payment. For those of you who have been wondering what the subscription prices are, here's the info:

USA 3rd class mail $25/yr
Canada (surface mail) $30/yr

Foreign (all) surface mail $32/yr
Europe/Mediterranean AIRmail $38/yr
Asia/Pacific area AIRmail $40/yr
AC Software Disk (global price)$ 9/yr

Subscription prices are for a 1-year period. AC expects to publish on a bimonthly schedule; however, if fewer than 500 subscriptions are received by Dec. 31st our publication schedule will be scaled back accordingly.

The AC Software disk will be a double-sided single-density "flippy" containing all the type-in software published in the magazine plus selections from the Public Domain. It will be produced and distributed 3 times/year, concurrently with every other issue of the magazine. The disk will be mailed separately. Our first disk is already in production and will be mailed out in January.

Issue #2 of

For those wishing to subscribe using a credit card, we take VISA & MasterCard! Just fill out your credit card info on the subscription form. PLEASE NOTE: there is a $2 surcharge for credit card orders. Credit card orders may also be placed by phone during normal business hours by calling Unicorn Publications at 313-973-8825.

We prefer that you should receive our magazine first before you subscribe. It will make our life easier if you use our form, plus it will give you an idea of what our product is like before you plunk down your cash.

If you so desire, you can send in a FREE AD with your subscription. Copy deadline for issue #2 is December 5, 1992. Personal ads up to 50 words in length are free to paid subscribers. See the "Swap 'n' Shop" column for rules pertaining to personal ads.

Send your postal mailing address NOW to ensure your name will be included in our mass mailout in November!!

4057. New terminal!

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-13 22:37:50 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9210132037.AA06560@brachot.jct.ac.il>
Source record: 109199

Hmmmm...

a coupla questions before my terminal emulator is DONE..

A) How is the Break key detected while R: is open (Telelink does it, so
I want to as well. You press break, and it sends a break.)
B) How is the Shift key (alone) detected?
C) How should keypad be implemented? 2 choices:

a- Ctrl-shift- 0 1 2 3 4 5 6 7 8 9 0 , . enter
b- Select-key (aka Omnicom)

Right now, A works, but I was thinking if both should work..
So, do ya think the b choice should also be implemented?

4060. GORF boot sectors - HELP!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-14 07:55:10 UTC
From: svhowardm@npe.isnet.inmos.co.uk
Message-ID: <1992Oct14.075510.1@npe.isnet.inmos.co.uk>
Source record: 109107

Anybody out there got GORF on disk?

I have, or rather had.

Whilst playing with a sector editor and looking at the boot
code, I had an inadvertant finger slip and WROTE to the first
four sectors of the disk!

Usually this kind of thing doesn't matter with games disks, but
GORF has a notch so's you can update the high score table. So I'm
really stuffed!

Can anybody send me a hex dump of the first 4 sectors??

Ta Guys.

4061. Latest Digi-Studio info

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-14 10:02:49 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct14.100249.5307@aber.ac.uk>
Source record: 109108

Here is the latest info on Package 2 of Digi-Studio.

All 3 packages are being merged into one big package. All the programs will be on one disk called the "Program Disk." Samples, tunes, and example LIDS .SRC files will be on another disk.

The manual is currently being re-edited, updated, and merged into one big document. This manual covers all the software supplied, and also contains a section on reading music. The manual is split into 12 sections, with 6 appendices. It is currently 28 pages long, and there's 2 more sections and all the appendices to add yet! It is being typeset and will be printed on a laser printer. The appendices will include many examples of LIDS programs with their corresponding snippets of music. The appendices will also include the examples referred to in the reading music section. These will be on music paper. Here's a full list of what will be in the manual:

Section 1 - Main Introduction to Digi-Studioo and booting info
Section 2 - Keyboard player instructions
Section 3 - Tune Player instructions
Section 4 - Sample Editor instructions
Section 5 - Tune Compiler instructions
Section 6 - LIDS system overview and introduction
Section 7 - Reading Music
Section 8 - Using the LIDS compiler
Section 9 - Using the text editor
Section 10- Converting music to LIDS
Section 11- Credits and copyright
Section 12- Support

Appendix A - Keyboard player note diagram
Appendix B - Examples on music paper for Section 7
Appendix C - Treble/Bass conversion chart
Appendix D - Full stave with note names for LIDS
Appendix E - Sharp/Flat alternatives
Appendix F - Examples of music with corresponding LIDS programs.

The full completed manual will run to an expected 50 pages. This will be presented as an A4 sized document, bound in plastic covers with a plastic spine. It is expected the manual will be printed on both sides of the paper.

The LIDS compiler is nearly finished. Error trapping is currently being added. Expected release date - Nov. 14th.

Dean Garraghty. djg0@aber.ac.uk

4062. Need MSDOS prog. to read atari disks

Help! I can't get these demos from a.a to work:

das_omen.arc
journey.txt
journey1.dcm
journey2.dcm
t1000.arc
top3demo.arc

Das Omen gives me a title screen which says to press space, but nothing ever happens.

The Journey thing just boots halfway and sits there. Same for T1000 and Top 3.

Someone please e-mail me on how to get these beggars working? (FYI: I'm on a 1200XL w/ Rambo & 2 USD 1050's.)

4065. Re: MIO RS232 Handler

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-14 21:59:09 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92288.165909JJMCWILL@MTUS5.BITNET>
Source record: 109111

You might check to make sure the version of Omnicom you are using doesn't have the 850 R: handler appended to it. Remember, the MIO does not need an R: handler loaded like the 850 does, and this MIGHT be the problem. Don't know for sure, sold my MIO a couple years back.

Jeff McWilliams

4066. Re: Demos from a.a

>t1000.arc
>top3demo.arc

I cannot get t1000.arc to work either. Anyone else having problems...???

I get the thing over in z modem then port thru null modem to the 1200XL.
It unarcs all of the files okay except for t1000.frm (I think it is .FRM)
and the t1000.obj file.

These two files give me an error having something to do with CRC.
I don't even know what CRC is so... I tried d/ling the thing about 4 times
now with different protocols and such. All of the other things that I have
grabbed from the archive work fine the way I was doing it. Is the arc bad?

It sounds like a GREAT demo from the text included in the arc! That is why
I tried to get it so many times... Any comment Bill???? Anyone????

Sam

rlcollins@miavx1.acs.muohio.edu (Ryan 'Gozar' Collins) writes:

> 1. How do you access individual elements of a CHAR ARRAY?
Just call it as "chararrayname(position)". "Chararrayname" is your
array, and "position" is where in it (from 1 to length (which btw is
stored in location 0 of the array!)).
>
> 2. What are the different variable types? (Difference between
> BYTE,
> CARD, CHAR ARRAY, etc)
Byte is a whole number value between 0 and 255 and takes up 1 byte of
memorry.
Card is a whole number value between 0 and 65535 and takes up 2 bytes of
memory. Just imagine how "DPOKE" in TurboBASIC XL (and BASIC XL I think)
and "PokeC" in Action! work and you understand. It's GREAT for system
pointers (like screen memory, display list, etc.)
>
> 3. How would you do the following in Action!?
>
> If name$="Test" then .....
>
> I can't figure out how to do comparisons with CHAR ARRAY.
This would be "If SCompare(name,"Test")=0 Then ..." If name and "Test"
are identical, then the returned value of the function "SCompare" is 0.
If name is "less than" "Test" than the number is <0 (aka -1), and if it
is "greater than" "Test" (BTW: all in ATASCII terms..."BOB" would be
greater than "ALICE" because of the "B" and "A") then it would be >0 (aka
1). Got it!? Good!

>
> 4. Is there any sort of INSTR command, like the one in
> TurboBasic?
Not that I've seen, but hey, it's a simple For..Do..Od loop in Action!,
and it would probably run just as fast as INSTR
>
> 5. Can anyone give me a list of CHAR ARRAY procedures? (Like
> real
> definitions to Scopy() Sassign(), and whatever else you can think.)
Action!'s string handling commands are as follows:

INT FUNC SCompare - it's a function. I explained it before. The two
parameters are what you want compared. If the 1st parameter is "greater"
than the 2nd, the value will be 1, if they are the same, it'll be 0, etc.

PROC SCopy - it copies a string. (aka "A$=B$") The 2 parameters are "destination" and "source".. so "LET A$=B$" in BASIC would be "SCopy(A,B)" in Action!

PROC SCopyS - it copies part of a string into another ("A$=B$(start,finish)") The parameters are dest., source, start, stop. "A$=B$(2,10)" would be "SCopyS(A,B,2,10)" and would copy the contents of B starting at location 2 and ending at 10 into A. (so A would be 9 characters long)

PROC SAssign - it's the compliment of SCopyS.. it works like "A$(s,f)=B$", copying a string into PART of another string. It's parameters are dest.,source,start,fin. Saying "SAssign(A,B,3,4)" would copy all of the elements of string B into elements 3 and 4 (erasing the old elements,mind you) of string A. It says: "If the space allowed (stop-start+1) in <dest> is greater than the length of <source>, then 'stop' will be changed to make the space available and the length equal."

>
> 6. Is there anyway to make the left margin in column 0 in the
> editor?
This can be done one of two or three ways:

1) Go to the Monitor ([shift]+[ctrl]+[M] from the editor) and type "O" (or "Options" or "oh no!" or whatever..just as long as it starts with "O") and answer the prompts. Pressing [RETURN] keeps them the same, pressing [ESC] exits from the Options prompt. The 2nd to last question i (is) "Left Margin? 2" .. just type "0" or whatever you want...

2) type "SET 82=0", which is just "POKE 82,0"

3) type "X Poke(82,0)" .. ditto ..this is the direct mode command (the "X")

and finally ..4) have a program do it.. if you have no program in memory, type "Poke(82,0)" in the editor, get to the monitor, and type "Compile" and then "Run" ("C" and "R" if you want..)... voila..

As for the string stuff... practice practice practice... and where exactly is your Action! manual, anyways!? >:-(grrr..

have fun

4068. Zybex is *NOT* PD

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-15 09:35:03 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct15.093503.26654@aber.ac.uk>
Source record: 109116

Various people have been putting their high scores for Zybex on the net. I very much suspect these people are using the pirated copy. That's right - PIRATED. Zybex is NOT public domain. It was written and published by Zeppelin Games in the UK some 4-5 years ago. Zeppelin were always good to the Atari, and produced some great games. Zybex was intended for sale on tape, and was sold in the shops for 2.99 (pounds). A disk version was produced as well, which appears to have been a bad move. The version sold as PD in the US (and I've been sent a copy to check over) is just a straight copy of the original, except the loading page has been sector edited and somebody elses name has been added, apparantly from Peru. Let me ask you this: if this was your game, would you let it go as PD? No, I don't think so. Also, if this is supposed to be from Peru, how come it's written by Brian Jobling. How many people in Peru do you know called Brian Jobling? Come on, think! You have to be EXTREMELY careful when getting software from some countries. Poor countries such as Peru, Poland, Russia, etc. have too many problems to worry about, without worrying about copyright laws, so this stuff goes un-noticed over there. Treat any game with suspicion. If it looks like the names may have been changed then be very suspicous. Zybex was crudely altered on the loading page, but the names in the game itself would be impossible to change. If you get some software you haven't seen before, and you suspect it may be commercial, then please contact me. It may be a British game, or I may have heard of it. I would like to try and put together a list of all games that are being treated as PD when they are not PD at all. I could then use this to warn people. One name to look out for is Jancz Pelz (sp?), and the Querope Agency. We suspect in the UK that these people couldn't write a program if their life depended on it! Avoid at all costs! Thank you for reading this.

KTG> I am a very fast typest and this tends to slow me down a bit...
KTG> The setup is ....Trasnkey-Omnicom-MIO-modem.

Somehow the key debounce timing is too long (everyone at one time or often
doesn't make a perfect make/break on a keyboard switch. In short, there
are often several contacts just miliseconds apart, i.e., key bounce - the
key debounce is simply a timer circuit that refuses to recognize the same
key within a very short period of time.)

Key debounce timing length is a POKEable address on the Atari.

I would suggest first trying a different communications package. I used
Term80, Express!, or BobTerm for several years under SDX with a one meg MIO
and hard drive with nothing like the above. I am often a fairly fast
typist also.

If it isn't the comm program, I would then start looking at the Transkey.
If I am not mistaken, how the Transkey works is to read the PC keyboard and
send the corresponding Atari keyboard signals directly to the keyboard
decoder chips as though the input had come from the Atari keyboard.

thanks

I don't know for sure what's going on there, but there are two things
that might have an impact. The convention at the archives has changed,
the index file is now called "0index", and directories are capilatized.
Also, atari.archive is moving to a different machine, so there might be
some temporary turmoil.

Dean Garraghty said some very good things about suspicious public domain
software. Zybex to be precise.
However, I'd like to point out to Dean that while there may not be very
many people in Peru with names like Brian Jobling, it would be wise to
keep in mind that the elected president of Peru has a Japanese name.
How many people in Peru are Japanese?
I'm not saying that Zybex is or isn't public domain. Just the logic to
help state his case is a mite fuzzy.

To all those people who responded...thank you...I have worked around the problem. Apparently.....with KEY ON it works just fine!
I had always had it off for Sparta3.2d because I believe it never worked well...and would lock with it set on...Somehow X works.
I still think it must be a "problem" with the program..for other terminal emualtors work well with the key off. In any case..I am happy.. and Omnicom kicks BUTT!

From: phbill@cyberden.uucp
Message-ID: <2RcRsB1w165w@cyberden.uucp>
Source record: 109127

My God! YOU're working on a terminal, too!?

Here's what you wanted to know (at least #2): To determine whether the [SH] key is being pressed, check location 53775. If it's 247, then [SH] alone is being pressed. If it's 251, then any other key is (except [CTRL] and [BREAK] and all those). I'm not sure what it is when a combo of [SH] and a key is being done, but you can simply test it, eh?

MY terminal program is being written in Action! and I'm trying to make it a lot like BobTerm, but in a way better. I've added a split-screen chat mode.. the bottom 12 lines of the screen become the "being sent" area, and the top half becomes the "being recv'd" area. If the cursor is already below the "being recv'd" area, then the screen is scrolled up (it looks pretty cool, too! ;))

Also, rather than have these commands:

[A]-translation
[D]-duplex
in the main menu, and then these:
[s^F]-translation
[s^D]-duplex
in the terminal mode (as well as main menu, dial menu, etc)

I simply use the [s^] commands (BTW: [s^] stands for [shift]+[control])

I don't think I'm going to add fine scrolling, because it'd be a tougher job with the split screen (maybe... dunno). Since the program is in Action!, modules of the program can be easily changed or added (and yes, I'll have the source code available.) So far, I've gotten Baud and Quit in the main menu, and Split screen, Translation (Atari/ASCII), and word wrap (ooh! can't believe I figured THAT out all by myself!!) done, and have all of the additional BobTerm-style generic commands planned.

Also, I'm going to make my capture menu a lot better than BobTerm's. You'll have more choices with what to do with your captured data. You can save it, cancel save, and abort it (clear), instead of just save and abort. Also, if you have a partially full buffer when you want to do a file xfer, you'll be able to either save it, abort it (clear), or CANCEL save!... this would let you get straight to the file xfer without saving OR erasing the buffer (so the file xfer buffer won't be as big as possible, but at least you won't loose data). Also, upon getting a "disk full" error during capture close, you WON'T loose the data (I HATE when that happens in BobTerm!!)

I also may add a simple game to play during terminal mode (and maybe even file xfer!?..) and possibly even a terminal -> terminal version of

the game (what will the game be you ask? so do I! what would you guys/gals like to see? DeTerm has a BreakOut clone (yawn), I think a simple Tetris clone might take too much memory, a puzzle game is out of the question (talk about BORING!)...maybe PONG!? ahhahaha!!)

Anyways... damn... I still have to finish AACode, MyNI_DOS, CrashMan!, and TrueFont... anyone wanna help!? hehehe

Have fun Itay.... did I ask already?- are you doing file xfer? and what language are you programming in (assembly, no doubt :))...

adios
(turning into a mad hacker!)

Hi! I programmed T1000.ARC :) It's bug was a problem with my UUencoded send. Get T1000.DCM - Mike Todd (THANKS!) fixed up my program and DiskComm'd it together.

As for the others.. I KNOW that Das_Omen doesn't work on the 1200xl's (I have a 1200xl! grr!) and I'll just guess that the rest of them might have the same problem.

I'm going to get Bob Woolley to fix up my 1200xl by replacing the Operating System ROMs. He's going to do it with EPROMs I believe, but there's another (slightly more difficult sounding, at least to a non-hardware hacker like myself) way of upgrading the 800XL OS and there's a text file on how to do it floating around. (I had it somewhere myself.)

Jeff McWilliams is also another 1200xl'r, he may be able to help.

I can remember getting the tape version back in 1989 along with the
disk version.

Whilst this may be old software it is not to my knowledge Public
Domain.

Re the comments about changing the name being impossible. Pleas3e
(opps please) think again about this one.

I can remember changing the lives so I could finish it.. from
memory (and this could be very wrong so do not do it) on
sector 9?(94) there is a EA 03 change to EA 09 and you have
infinite lives. Hmmm I knew I should have made a record of all
these changes..

$.02; A good way to check if software is pirated is to support people that still support the 8-bit. To find out Zybex is pirated, all you have to do is get a copy of B&C ComputerVision's catalogue. For instance, ZYBEX is listed under their "New Software From Europe" page for $20. Seems a little high if the European price was $2.99 pounds, but the point is one of the shops that has supported us for the last decade+ makes their living selling the program. I still blow $50 to $200 a year on my 8-bit, last titles I bought were the Phantasie Series for instance, just took me a while to get around to playing them<g>.
Anyway, at this stage of the game, at the very least we should have a catalogue handy from one of the outfits that still supports us. If we have a gross excess of cash, maybe trickle a few bucks to one of the shops.

Well... this is something you can blame on BobTerm! :) It sucks at ASCII-sending BIG text files... every time it refills the buffer, it accidentally sends a little more garbage. The file T1000.FRM is the graphics file (FRaMes) and T1000.OBJ is simply TurboBASIC XL's RUNTIME.OBJ, the runtime package. The CRC is a checksum error.. it means that the data that came in to be unARC'd didn't add up to what it was originally (ie, you may have some data: "ABCD", and when unARC'd you get "QESM" or something, and it knows that "ABCD" is not the same as "QESM"- most modem xfers also use CRC checking (like Xmodem-CRC for example!) to be sure that the data it received in the block was what it was supposed to be.)

Anyways... you can do one of two things with T1000.ARC. Delete it and get T1000.DCM (which Mike Todd was kind enough to put together for me, which includes the partially killed T1000.FRM (the last frame is a little off at the very bottom, but you get the idea) and a fresh copy of the RUNTIME.OBJ file), or, you can make your own version of what Mike did by getting a copy of RUNTIME.OBJ and running IT instead of T1000.OBJ (ya could even rename it to T1000.OBJ after you delete the corrupt one).

Sorry for the trouble.. I thought it may've been deleted from the archive by now...!?

4090. Display list HEEELLLP!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-17 20:00:29 UTC
From: phbill@cyberden.uucp
Message-ID: <iF2ssB3w165w@cyberden.uucp>
Source record: 109137

I've made a display list for my new terminal program (actually, I stole it from my BBS program I was working on (and junked) in BASIC) which has two lines of GR.0 at the top pointing to an 80-byte area of memory, and it's only POKE'd to, no PRINTing to screw up any data below the 80 bytes, and then I have 1 scan line of background, and the normal screen proceeds after that (24 lines of gr.0, pointing to screen memory... scmem was moved, but it doesn't really matter... i stuck it up above RAMTOP (PEEK(106)-something) My problems are as follows:

1) flicker... I get a split second of gunk on the screen ever so often... esp. during data rec'v

2) i get a screen full of the same line of garbage (I guess it to be a GR.15 or Gr.7 line) which goes from above the top border to below the bottom border and just sits there (sorta pulsating) and my program is dead til I hit [RESET].. this usually happens when I rec'v TONS of data...

and finnally..

3) i get a blank screen (as if someone turned the ANTIC DMA off (POKE 559,0), and it WASN'T ME!! :)).. and of course, the program crashes... usually burning afterwards (ie, unrecoverable... RESET gets me to a GR.0 screen and it just dies... I have to boot)

I'm programming in Action! (that's >I'm< "programming" in >Action!<, if you get my drift! ;) I'm a total amature, and I'm trying to do complicated stuff that I suck at even in BASIC..!!!)

Here's what I did w/ the screen/display list. I pointed a menu screen to a location behind RAMtop, then I pointed the terminal screen next to it (I forget if it was under or above), and finally, I pointed the display list behind RAMtop somewhere else, copied the normal GR.0 display list to there, changed the top few lines (adding the two data lines and scan line worth of border at the top of the screen) and changed the pointer at the bottom of the display list to point to its new beginning (I never understood this for a long time.. what you do at the end of the display list is put a "65", then the LSB/MSB for the beginning of the display list... or is it the beginning +/- something? Maybe that was my error.. I don't have very good refrences for creating my own display lists, and I didn't really look at any of them because I supposed that if it worked in BASIC ok, it should work in Action! ok too..

OH! btw: one major note, I totally Zero() the RAMTop area that I use BEFORE I use it... that way any old data doesn't get misinterpreted (esp. in the display list area, cuz I may not've filled it ALL up..that

way, 0's are left where they might need to be...)

!?!?!?!? HELP !??!?!?

thanx alot bill

4091. 5200 vs XL

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-17 23:51:31 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <67924@cup.portal.com>
Source record: 109139

Just a quick note; I was hanging out in a surplus electronics store & happened to come across a 5200 mother board. It's got a 6502C, Antic, GTIA, & Pokey. Apparently, they used the Pokey to interface with the joysticks & left out the 6520. The OS ROM just has a character set with some cartridge initialization code => useless. Anyway, if you want an XL chipset (I tested all the chips in an 800xl) & come across a 5200, you may want to pick one up. The chips seem to swap W/O problems.

Using the LMS (Load Memory Scan) bit in the 1st GR.0 display list line?

>1) flicker... I get a split second of gunk on the screen ever so often...
>esp. during data rec'v

This sounds as if you have the JVB (Jump and wait for Vertical Blank) set
incorrectly:

>there, changed the top few lines (adding the two data lines and scan line
>worth of border at the top of the screen) and changed the pointer at the
>bottom of the display list to point to its new beginning (I never
>understood this for a long time.. what you do at the end of the display
>list is put a "65", then the LSB/MSB for the beginning of the display
>list... or is it the beginning +/- something? Maybe that was my error..

The 65 is the JVB instruction to ANTIC. It actually is ignored during
"normal" processing because the deferred mode VBI somehow automatically
jumps back to the beginning of the DL. During critical I/O, though,
the deferred VBI is suspended (deferred), so the display, without an
appropriate JVB at the end of the DL, becomes garbled. (This was
detailed in Creative Computing, "Outpost Atari", sometime in the
early 80's -- 1981? October, perhaps?) The JVB, if I recall correctly,
simply should point to the beginning of the DL.

I'm not sure what would cause your other problems, which seem to
be basically the total destruction of the DL and other memory. You
might simply be reading data accidentally over your DL.

I couldn't agree with you more... I hate the system of info. concerning 8 bit software now... It os all second hand since no one knows where or when the] legal release of something occured.

It is almost too small of a community to dispute such things... Some think it is PD, some don't. Where do you draw the line. In the U.S. something could have been released to PD where as it never was elswhere.

I know this may not be the case with Zybex (I have never seen the game) but such things as copyrights and such worldwide are flimsy at best.

There is no way that in this technical age that you could limit piracy over seas (as if you ever could....) but to worry about some 8 bit atari prog. becoming Brazilian (or whatever) after its release is the same as any int'l prog. Who the hell knows what some creep will do to something in a third world nation once he gets ahold of it.

This is the nineties... If you think piracy was bad in the '80's then get a grip... what makes anyone think that it would be dead in the '90's...
(no matter what machine your programming for...)

My .02 worth,

Sam

I think the only way you can hang is if you've got a variable or array residing in page 0 or maybe the hardware address space. 2nd choice would be you're over writting either the area where your DLI routine resides or a ram vector so when there's an interupt, the system jumps to garbage. Just a suggestion for any 1st pass debug'n in Action! Stuff like
BYTE spare=0
is not the same as
BYTE spare=[0]
Personally, this is my favorite mistake, I use it all the time <g>. Same thing for arrays, pointers, etc. I always check my declarations 1st & use the monitor to print out all my variables. Make a list of all the variables, go to the monitor, compile, then "? spare<RETURN>"
This will tell you where the variable is in memory & it's initial value.

4099. Color Composite video+audio monitor for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-18 17:32:00 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00962472.26DA22A0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 109147
Cross-posted to: misc.forsale,misc.forsale.computers,comp.sys.atari.8bit,comp.sys.cbm

For sale-

14" composite color monitor with video and sound inputs.
Excellent picture quality, color and sound.
Made in Japan by BMC.

Useful for the Home Computers (Atari 8-bit, Commodores, Apple // series,
Texas Instruments TI-99/4A and similar ones with composite video color output).

Also useful as a VCR monitor- connects directly to your VCR, without any RF
modulation -- you'll get a MUCH better picture than most TV sets will display.

Depending on your application (computer, VCR) I might have a cable to hook up
the monitor to your computer and/or VCR.

Asking $85 or best offer. Please feel free to make offers, and respond
to e-mail address COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 if you
do not have e-mail access.

Thanks you.

Dean.. I wouldn't go around almost ripping on poor countries... but yes, I totally agree.. as a programmer, if I ever start SELLING software (which I AM planning on doing... aka "CrashMan!"), I would hate to see my wares floating around for free after I worked long & hard to get the damned thing done. I'm always looking out to see that I don't break any laws myself.. (ie, I'm always worried about what Action! stuff I'm using, because much of it is (c)'d) and like I once pointed out before, I had to get all over AtariBase's case for having pirate stuff on the board!!!!!!! SHEESH! Who the HELL'd be SOOOO stupid as to pirate and then UPLOAD a copy of one of ATARI's programs on ATARI's board!!!! DUH!! I don't think anything ever got done except the removal of the software..

That's one of the reasons I don't call AtariBase any more... they REALLY don't care about 8-bits any more.. REALLY!

Well I finally have to sell it all.
Everything is for sale in one lump package for only $200 Postage Paid!
(in the USA, elsewhere may have to pay for shipping)

What you get:

Atari 130XE Computer with new keyboard
1030 Modem
1050 Disk Drive
Comodore 1702 Color Monitor (very sharp and clear)
APE Face Parallel Printer Interface
Atari Joystick (Original style)
cables to hook everything up.
original manuals to everything.

Programs:
Paperclip (with spell checker, manuals, and hardware key)
The Hitchhikers Guide to the Galaxy
Mr. Do's Castle
River Raid (cartridge)
Mountian King (cartridge)
Miner 2049er (cartridge)
K-Razy Shootout (cartridge)
Basic Language (cartridge)
Chameleon CRT Terminal Emulator (does 80 columns)
Lots of other games and assorted stuff.

Books:
Atari Graphics (by Compute!)
Mapping the Atari (VERY GOOD and complete)
Inside Atari Basic
Best of Antic Anthology vol 1 (with disk)
Atari Basic Quick Reference Guide.

A bunch of old Antic and a few Analog mags.

Any questions just write.

Greg Hartman

--snip--
BTW: my style in Action! programming is very different from any other style format I've ever seen (maybe I'm sick!? :) better check my temperature). Anyways... I indent only 1 space when I structure (saving both memory and line width), and when I use a "Do..Od" loop, I put the "Do" on the line of the loop command it uses ("For", "While", etc. I also comment when they are "Repeat..Until's" with a "Do ; Repeat", and I put the "Od" on the same line of the "Until."

Does anyone else out there have a style they think looks really good and is efficient for programming in Action!?

Adios - - - - - -

Hay Bill, just took a looke at the code for the stars in Action!. There is one thing I would add, Action! tends to hang when returning to dos, that is unless you point it in the right direction. I'd add an extra proc...

```
PROC Go_DOS() ; no "RETURN" is needed since we just go to DOS from here
[$6C$0A$00]
```

Just a jump to dosvec... Just add one more command after the until loop calling Go_Dos and you'll exit cleanly to dos.

Hope it helps

Mike...

Well Bill, I ran your stars demo, not bad but..... You say you want to see a better stars demo in Action!? Here is one that was sent to us a few years ago. Show the use of VBI's and DLI's in Action!, as well as the use of ml code.

The code comes from issue 18 of Analog.

```

4112. anybody got a GEnie account?

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-20 20:14:46 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92294.151446JJMCWILL@MTUS5.BITNET>
Source record: 109060

Rick Reaser mentioned some pretty interesting sounding articles in the last issue of Current notes, that are available on GEnie. Is there any gracious souls out there who could upload these file to the Archive for us Internetters? The files he mentioned were:

5944 Transkey modification (especially interested)
5952 A talking RELAX demo
5969 plans to make a MIDI interface for the 8 bit

He also says there are some good Turbobasic programs on there.
With this dialect of BASIC being the most popular and easily obtainable for today's 8 bitters, perhaps they deserve consideration for uploading to the I-net as well.

Jeff McWilliams

4113. Happy 1050 with Controller for SALE!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-20 21:52:02 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <BwFwqq.8xo@mentor.cc.purdue.edu>
Source record: 109061

For Sale: Happy 1050 with Happy Controller Option and
Version 7.1 Software.

The Happy option will allow you to make copies
of about ANY 8-bit software ever made and be able
to read and write in single density, enhanced density,
and true double density with much FASTER disk access
than normal, although normal speed can be selected.
This is GREAT for backing up your collections of older 8-bit
software that you are concerned about losing!!

Price: $160.00 plus shipping.

The Happy Controller is a professionally installed
option that allows switch selection of regular speed
or Happy speed disk I/O. There is also a three position
switch that allows:
1) Writing regardless of write protect notch.
2) Normal Position
3) Write not allowed under any circumstances.
There is also a yellow light between the new switches
that is lit if writing is allowed.

The Version 7.1 software comes with Warp Speed DOS,
a sector copier, a Happy backup program, and diagnostic
and utility programs.

If interested, please e-mail to lenn@mentor.cc.purdue.edu
or lennjm@sage.cc.purdue.edu

This drive is in PERFECT condition. I have treated it with
the utmost in care.

Thanks,
Jody Lenn

4114. Mint Condition 65XE and software for SALE!

4116. A few more Action! questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-21 04:03:22 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Oct20.230323.13754@miavx1.acs.muohio.edu>
Source record: 109071

1. How do you access individual elements of a CHAR ARRAY?

2. What are the different variable types? (Difference between BYTE, CARD, CHAR ARRAY, etc)

3. How would you do the following in Action!?

If name$="Test" then .....

I can't figure out how to do comparisons with CHAR ARRAY.

4. Is there any sort of INSTR command, like the one in TurboBasic?

5. Can anyone give me a list of CHAR ARRAY procedures? (Like real definitions to Scopy() Sassign(), and whatever else you can think.)

6. Is there anyway to make the left margin in column 0 in the editor?

7. Any other commands in the editor or compiler that are not that easy to figure out? (Like how to compile to disk?)

I've only used Action! a little bit, but I like it a lot, I doubt I will ever go back to Basic!!!!

Thanks a lot!!!

(P.S. I will be getting the manual soon!!!!)

Later.....

djg0@aber.ac.uk (Dean John Garraghty) writes:

>Does anybody know if a US 1050 drive will work unmodified in the UK. Obviously,
>I will be using a UK power supply, but I reckon this will cause timing problems?
>Anybody know?

It will work, (probably not with some protected software),
It will revolve slower than usual, probably around 240 rpm insterad of 288.

>Dean Garraghty.

4118. 1050 Disk Drives

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-21 14:48:43 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9210211448.AA17061@smithkline.com>
Source record: 109067

In response to Dean Garraghty's query about stock 1050's running on British voltage mains, it should not make any difference at all. The external power pak is only a transformer, it will drop the 220V mains down to the 9VAC the drive requires. European mains are typically 50Hz, but this will not affect RPMs as drive speed is NOT synched to the power line frequency. The 1050 uses a 2917 tachometer chip to set drive speed; it operates off the drive's internal DC bus. Any conditions that would drop drive speed to 240RPM's would render at 50% of software unuseable. I've experimented with this. Incredibly, I found some software on single-density disks that would still load at 230RPM, to the accompaniment of pauses & hiccups. Below 220RPM pretty much nothing will load.

I think the reason Atari placed oversize filter caps in the 1050 power supply was to ensure adequate filtering even at the lower line frequencies used outside North America. Many 1050's had 6800uF caps, which is overkill for the USA but probably saved Atari money in not having to manufacture a separate drive for foreign markets.

$.02 The Go_Dos() doesn't have to be called as a PROC, matter of fact, it may even be better if it isn't. You can just have the code block as the last line of your main(). We got in a discussion about this on CI$ once, main worry was clearing the stack since you have all the JSR's in any compiled Action! program. People were talking about the various JMP $E477 etc & someone came up with an elegant solution. It was just something simple like a TSX ??? ??? ??? but it escapes me at the moment.

From: troyer@finmark.nynexst.com
Message-ID: <TROYER.92Oct22102911@finmark.nynexst.com>
Source record: 109068

I have recently dug up my old 65XE and 1050. Luckily, I still have the I/O cable, but I don't have either power supplies for them. Could someone send me the pinout for the XE's power connector and the power requirements of the 1050? I recall talk of a hardware/technical FAQ out there - does this exist? Oh, I could also use the pinout for the 5-pin DIN A/V cable for I can't seem to find one of those in my cable archives.

Thanks in advance,
-Tom Royer

Remember my fast coprocessor on the Parallel Bus Idea? Well, I haven't been getting too far with a theoretical design lately. I've gotten caught up in school lab reports, quizzes, and helping Ben Poehland with the Atari CLassics mailing list database. He and I spent a long time on the phone this weekend getting the database in order, we're using turbofile, he on a computer with multiple, 1.44meg floppies connected to his Black Box, me with one 720K drive and a 1 meg RAMDISK. ALl this RAM is good for something after all. Sorts took up to 4 times longer for BEN than for me.

Then Sunday we encountered this really nasty bug which took all the people whose first names begin with AV-BE, and wiped them out, replacing them with all the people whose names begin with N-NO or something. Pretty horrible... thank goodness for backups. Anyway, we all should be seeing Atari Classics darn soon.. as long as no more gremlins creep into Ben's house while he's sleeping... I think he mentioned wrapping up the database this weekend and printing all the labels.

You'll probably hear more about our mailing list experiences in a future installment of my column, including an in-depth look at Turbofile, and its companion word processor, Turboword+.

SO, not much time to think about 65816s and stuff. I've been lurking around on C.S.Apple2 lately, since they're really gung ho about 65816s and all sorts of other things. I ran into one guy who is working on designing a high-res display card for the Apples. It uses the TMS34010 chip from Texas Instruments. It's a pretty fancy chip, runs about $35.00 or so, (I think, his price quote was Canadian). He said all you need to talk to the chip is 16 locations on a bus somewhere. Well, gee, we've got all sorts of address space in $D1xx, the Parallel Bus hardware area. They use a 6502, so do we, their bus speed is 1mHz, ours is 1.79mHz, not many problems there. I'm gonna keep in touch with this guy.. see how things develop. I think I saw USA-Flex selling refurbished VGA greyscale monitors for like $80.00. You could really have fun with something like that... and later buy a VGA color monitor... if you wrote software for it of course.

If you're just interested in 80 columns, there is the 6545 chip. It outputs to a TTL monitor, Bob Woolley published a design back last year I think. I finally got data from Rockwell on this chip, and if Tom Hunt doesn't beat me go it (which he probably will) I plan on writing some E: drivers for a board based on Bob Woolley's design.

So what would you like to see... simple 80 columns.. real cheap, or should I also continue looking into the possibility of a higher resolution display card? It wouldn't emulate the regular Antic modes... you would probably end up needing two monitors.. one for 40 columns.. one for VGA graphics.

You would need software written to use the display card, like a drawing program, or something. I think an 80, or 132column E: handler could be written though... maybe AtariWriter 80, Turbofile, and turboword+ would work on it... only the display updates could be really fast.

Jeff McWillimas... who's looking for a more appropriate signature poem.

4125. Digi-Studio in the US

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-22 12:56:40 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Oct22.125640.13867@aber.ac.uk>
Source record: 109069

It looks like I have a distributor for Digi-Studio in the US. We've just got to work out the details. This will happen in about a week when we have a live meeting in London. What I would very much like to know is:

1. Would anybody in the US now be interested in buying it?

2. How much would you be prepared to pay?

Don't forget the full version will come with a 50 page fully typeset and laser printed manual, and will come on at least 2 disks. This thing is huge if I might say so myself! On first estimates, it looks as though it will be expensive in the US, even if I give up most royalties on it. The manuals will cost a fortune to print, and then pounds have to be converted to dollars and so on. I would say that $30 is a rough estimate at this point. Is this too much?? I would be grateful for opinions on this by email. Thanks.

Dean Garraghty. djg0@aber.ac.uk

I'm tired of wrestling with these terrible "ProLine" controllers that came with the 7800. I've tried connecting my Sega Genesis Powerstick to the 7800, and it confused the 7800 so bad that it wouldn't get past the "Atari" logo.

Now, I can probably reverse engineer a simple gender bender type of plug to allow the Sega controller to work, but I'm hoping that someone has already done the hard work for me. Any takers?

I've made a program to convert ColrView images into grey images (in both Gr.9 and Gr.15 modes (Gr.9's converted from 4096 color pics., Gr.15's from 64 color pics.)

It works rather well, but the program isn't that good. Add to it if you like, etc.etc. Be sure to keep my original credits in there, and add who you are, etc. to whatever stuff you add to the program... Also, add 0.01 to the version number when you update it.. Have fun!

(btw: reason for this program: difficulty (lack of code floating around) and HUGE size of ColrView image viewing. Also, it's a way of getting GIFs into 4-grey images. Just load them with Jeff Potter's APACView as ColrView15 images and then load up this program...)

I'll possibly post a UUencoded version of the .COM file for all of you Action!less users out there. :) If you're too impatient, get an Action!-owning friend to make a .COM version for you. ;)

I would be more interested in a cheap 80 columns. That way I could add 80
columns to all the 8-bits I own. It would be faster than Atari's 80 coumns,
wouldn't it? And it would be compatible too?

BTW, what 80 column chip did Atari use?

Of course it does - that's a vector JMP instruction to jump through the
vector address in DOSVEC (location $000A, 10 decimal).

Message-ID: <1992Oct24.021235.19117@cs.tulane.edu>
Source record: 109077

Hay Bill, a jump through DosVec (Hex $000A) will always return you to Dos.

"Start vector for disk software."

"This is the address Basic jumps to when you call up Dos. It can be set by the user to point to your own routine, but reset will return DosVec to the original address. To prevent this, Poke 5446 with the LSB and 5450 with the MSB of your vector address and resave the Dos."

Now, if you've compiled Stars3d.act, you know that hitting the Start key will not cleanly return you to Dos... Stars3d leaves a VBI laying around... You must clear this VBI before Jumping to DosVec.

(BTW, the above is from Mapping the Atari By Ian Chadwick, Yeah I know you already know that but ya gotta give credit where credit is due.)

Some of my post have been disappearing, but... you don't have to make the Go_Dos into a procedure, you can just have the code block [$6C $00 $0A] as the last line of your code vs RETURN. Somebody on CI$ posted a cure for this, it was just a simple code block at the start & end of your program to get the stack pointer (I think?) pointed to the right entry. I can't recall the routine, but it was by popular acclaim , the best way to do it. A lot of us put code on the bottom of page one, so if you had a routine that was called a number of times the stack would eventually grow down & trash it. I'll look around & see if I can find it.

Jeff McWilliams mentions, among other things, the possibility of a Parallel Bus card containing a TMS34010 graphics controller chip, as an external graphics enhancement subsystem for the Atari 8-bit. Hear, hear! I've been working for a year or so now with a graphics board (for a DEC VAX) that uses the TMS34010's big brother, the TMS34020, and it's very nice! It's essentially a complete CPU optimized for graphics, and there even exists a standard set of graphical-primitive routines ("TIGA") for it. I imagine there'd be some expense involved in licensing TIGA or duplicating its functionality in custom-written TMS340x0 code, and you'd also (probably) need a colormap chip and a hefty slug of VRAM (video RAM), and I don't know what that would do to the PRICE of such a board. Maybe I'm wrong, but I wouldn't expect a several-thousand (or even several-hundred) -dollar add-on graphics board to be a big seller in the Atari 8-bit market... It'd perform like a mother though. ;-)

Chris Chiesa

BTW (because we're talking about Action!) I've just included the code blocks for Go_Dos, SetVBV, DLI etc with my runtime package... I never again have to think about recreating the code and its always there if I need it. (plus leaving it named as a proc makes it easy to debug...)

Chris,

Yes, words of wisdom. TI wants $40.00 for the databooks for the
TMS34010... which include all sorts of goodies in them.
I'm gonna have to wait on those books.. so this is ANOTHER of those
long term projects. (darn). Knowing nothing about the TMS34010,
what it includes and what it doesn't, it sounds like you may be right
about the cost of the board.
The amount of VRAM would depend on what resolutions and colors
you want out of the thing.
This guy I've been communicating with on the Apple board seems to
know what he's talking about, and already has the databooks and a chip
or two. Since I've currently got nothing but time... I'm gonna see what
he comes up with... he said if the design is successful, he'd probably
borrow me the schematic, and from there I (we) could adapt the
interface to be PBI compatible instead of Apple port compatible.
If his card goes commercial, he won't be able to give me any
code used on the card though.

Like I said, the TI chip will probably run about $35.00,
probably figure some bucks for the VRAM, and all the other support
chips. I don't even know if, at the speed the 34010 runs (20 mHz??)
if you can get away with wirewrapping the board.. or point to point
soldering. Of course, it would be cool to have enough people interested
to have a place like CSS produce the boards commercially for us.

Jeff

Source record: 109089

I think $30 is a reasonable price for a high-quality professional software package (well, it's actually better to ask $29.95, in the style retail trade).

For comparison, last year's ChromaCad program- the most recent commercial release I'm aware of- consisted of two separate packages that sold for $29.95 each. Now the combined package is selling for $29.95. Each module in Chroma-Cad consists of a professionally bound/printed manual plus one or 2 disks.

An independent review in Atari Classics would make interesting reading if we were to receive a copy of the program from the US distributor....

4142. 80 Column Video

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-26 15:25:22 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9210261525.AA24413@smithkline.com>
Source record: 109090

In response to the posts by Jeff McWilliams & Ryan Collins, Jeff's 80 column video ideas are extremely interesting & I hope he will pursue at least some of that in Atari Classics. A cheapie DIY 80-col display to start, then VGA if it looks feasible for the weekend solder-jockey.

The video driver chip in the XEP-80 is the montrous 48-pin NS-405 or 455 (Atari used both in production units). Dadblammitall, I haven't been able to find a source for this chip ANYWHERE & don't even know if it's still in production. It was made by National Semiconductor. Many people think this chip is another custom LSI like ANTIC, etc. Not true! It's an off-the-shelf chip, which makes my inabilty to second-source it all the more annoying.

Over a 7-month period in 1991 I engaged in a titanic struggle with National to obtain specs on the NS-405/455. I was finally successful only after I gave up doing things honestly & starting telling them pitiful tales & huge lies. As far as I'm aware they didn't print specs on this chip in any of their usual databooks. One of the Alchemist projects I had under deverlopment while I was still at Current Notes was an 80-column TTL driver run off the XEP-80. According to the chip specs it IS theoretically possible. I'm not familiar with Bob Woolley's design but would be most interested to see what he did. The main point of design constriction there is whether some sort of buffer would be needed to drive the monitor inputs without blowing up the NS-405.

BTW, Jeff's comments about Atari Classics & our TurboFile database are right on. This past weekend was most productive, AC will be going out on time (I'll post a separate Bulletin the next day or so). There was enormous slaughter of gremlins, a graveyard crew is still shoveling their mutilated disgusting little corpses out from under my 800XL & the new 20meg hard drive AC's circulation database resides on (whew!). TurboFile is a real gas, bummer those MicroMiser people quit supporting it.

********** A T A R I C L A S S I C S **********

pdate update update update update update update update update update update upd

I was just thinking of the lines from a dumb train song:

"Let me tell you the story of Old 49
The fastest engine on the Santa Fe Line:
In April of '44 she made her made her wild dash,
She made it on time and she did not crash."

Well, not much drama there!

And I'm pleased to say, that's pretty much how it is with Atari Classics. With absolutely invaluable assistance from Jeff McWilliams (he saved my butt, & probably saved the magazine), I completed the print run of mailing labels for the Premier Issue this past weekend. They are now on their way to our Publisher by 2nd Day Air, & distribution of the magazine will commence this week barring unforseen catastrophes.

It looks like the mass mailing of our free Premier Issue will go out to just under 800 people.

As result of our activities at the WAACE Fest, subscriptions are now trickling in, about 25 I think. I'm very encouraged that 75% of paid subscribers so far are going for the disk as well.

Our Advertising Editor, Dr. Roland Herman, just informed me last week that the ad blitz we are conducting to solicit commercial advertising is in full swing. Approximately 70 letters were sent out to the vendor community to let them know we exist & that our commercial ad rates are a bargain.

So, now that our mass mailing is in the works, does that mean you can't get your free copy of our Premier Issue? NOT AT ALL! We still have several hundred issues not spoken for. Those are sitting in my living room, I'm dying to give them away! Send your postal mailing address to:

ATARI CLASSICS
179 Sproul Road/Rt. 352
Frazer, PA 19355
ATTN: B. Poehland, Mging. Ed.

We will continue to distribute free copies of the Premier Issue until the mailout of Issue #2 in January 1993 or until they run out, whichever happens first. Get 'em while they're hot!

And, for everyone who's been dying to press money into our hands in return for a subscription, let me assure you we are AT LAST accepting money!

This thing is FOR REAL, people. There's a subscription form on the last page of the Premier Issue, we take credit cards & everything.

And all of you who were on the Internet a year ago when this AC movement began- & who participated in the Mail Campaign- give yourselves a big pat on the back. Without your support, & the 615 folks who responded to the Campaign, we would be nowhere. A year ago our community was in total disarray. It is we ourselve who have given our community something at last to look forward to. We are our own future, & Atari Classics is the expression of our collective desires.

This will probably be the last Update/Bulletin type thing I'll post. From this point forward the magazine will either be carried to ultimate success by the user community that gave it birth, or it will fail if the user community turns away. You'll all get a chance to vote in November (pun intended!).

A few curious notes. Rick Reaser, the 8-Bit Editor of Current Notes, was Paid Subscriber #1. Myself, I came in a tad slow at #24. We both took the disk.

And, I'm hoping, the rest of you will follow our example.

I have just put a text version of my full PD catalogue on the archive. It is currently in New and is called pdlist.txt. It contains a listing and descriptions of all 150 disks in my PD library here in the UK. It also includes prices and ordering instructions for the UK and US. If you don't have access to the archive, then email me and I'll mail you a copy of the catalogue.

Duke,

What you need is a regular RCA-RCA cable and one of those TV Game boxes that come with Nintendos, Atari 2600 machines, etc.
You should be able to find both of these at Radio Shack, or maybe even Kmart.

Hello all,

I posted here before but did not receive any response. I am looking for the pinouts for the a/v connector and power connector on a 65XE, and the power requirements for the 1050. If anyone has this info, please mail it to me - I would very much like to get my 8bit up and running again. Someone mentioned a technical FAQ of some sort I think - this would be helpful as well.

Thanks in advance,

-Tom Royer

OK, but I don't own a 65XE so I'm guessing it's the same as a 800XL.
Looking at din connector:

7 6
3 1
5 4
2
[6,1,4]=> 5 volts
[7,3,5,2] & shell=>ground
If you cut your own supply, it should do at least 1.2 amps.
The 1050 takes a 9VAC supply that can deliver 31VA. You may be able to sub something in the 12VAC range since it has it's own regulated supply within the drive. Video... last time I replied to this, I had someone jump on my case<g>.
N
3 1
5 4
2
3=>audio, 1=>composite lum, 4=>composite video, 2=>ground, 5 NC

4157. SIO Chip

Message-ID: <1cptpmINNq08@usenet.INS.CWRU.Edu>
Source record: 109103

Which chip (name and number) controls the SIO port? I believe mine's
gone bad. I can't boot off of my 1050 and SIO2PC will only boot
the first time the 800 is powered up, after that it doesn't respond.
It's a stock 800, by the way, if that makes any difference...
Jeff

4158. Emulation

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-30 01:12:50 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Oct30.011250.11803@dartvax.dartmouth.edu>
Source record: 109104

I'm interested in writing an emulator for the 800. I don't have much free time, so I'm not sure if I'll ever get it done, but...

I figure it should be really easy to write a 6502 emulator in C. The CTIA (or, if I get ambitious, GTIA) emulator would be a bit more work and system dependent (I'm thinking of doing it for VGA or possibly X). For now, I'm not even thinking about sound.

I'm aware of the copyright problems associated with copying the OS, so I would design the system to intercept legal (and common) calls and call C functions that would be part of the emulator. If I get really ambitious, I could even intercept calls at a higher level and provide DOS functionallity without loading DOS.

I have a few questions:

1. I understand that much of this work has been done before, but can't be released because of copyright problems. Could parts of it be released to be integrated into this project?

2. Would other people who are familliar with C be interested in helping write portions of this project? Besides the graphics, the biggest part of the task will be writing all the OS routines in C.

And no, I'm not committing myself to doing this. It's something that I would like to do, and I have a lot of design ideas for it, but getting my Ph.D. work done is by far my highest priority.

--PC

Well... with the 1200xl you can hook it up to a TV one (or even both! :)
) of two ways....

"Switch Box" - all you need here is a simple RCA-style plug and a switch-
box (available at the local Radio Shack store) and pos-
sibly an antannea(sp!?)-to-cable converter (simple little
peice of plastic and metal that has the screws for ant.
wires, and a plug to hook it up to cable.)
This set-up all depends on how you have your TV set-up
already, and what type of switch-box you get. (btw: switch
boxes are also called "TV/Game Selectors".)

or

"Monitor" - here you require a monitor or TV that has the two RCA (video
and audio) ports. Then you have to get (or make) a monitor
plug to fit in the "monitor" port in back of the 1200xl. The
Commodore 64 monitor plug works great. If you have it set up
this way, you'll most likely just need to hit the TV/Video or
TV/VCR button on your TV (or VCR!) to select the computer,
rather than changing the TV to channel 3 (or 2, depending on
how you have the switch on the back of the 1200xl set) and
then reaching in back for that crude little switch-box. :)

Anyways... hope you understand that (it's late!) later

>

Well... there are many different formats out there that the Atari can
read, and a few it can write. These include:

GIF R/W
IFF R(/W? never seen in tho)
PI? R (those ST formats)
PI9 R/W (256 color APAC pictures)
PZM R/W (256 color hi-rez APAC pictures...also ".ILC")
RLE (R/W? they'd seem simple enough...)
PIC R/W (these are usually the compressed (most commonly known as
"Koala-style") bitmapped pictures, also ".KOA")
GR9 R/W (this is the graphics 9 (grey) images)
PIC R/W (confusing... "PIC" is also sometimes used for normal Graphics
7 (160 x 96 x 4) and 7.5 (7+, or 15) (160 x 192 x 4) pictures.
I personally name them ".GR7" and ".G15")

There're many more out there... again, the most commonly used are the
PIC and GR9 files. The formats from other systems include
GIF - >the< standard
IFF - ILBM Amiga files
PI? - Atari ST's (I'm not sure of all of the ST formats readable by
8-bits)
RLE - if these exsist... these are great for sending online... I dunno
too much about them, but thier format is so simple it's sickening..

The only types of non-Atari files (that >I< know of) that can be made are
GIFs, but these can only be made out of 320 x 192 x mono, 160 x 192 x 4
color, and 80 x 192 x 16 grey images. (no 256 color GIFs to show
off...darn)

Oh, I almost forgot!!... another wonderful format is the ColrView format.
These files are saved as 3 seperate files (although I mentioned to the
programmer, Jeff Potter, that it'd be just as simple to have one single
file and have the 3 parts appended to each other..) These are named
".R", ".G", and ".B" (and if ColrView ever works with single files, I'll
suppose they'd be called ".RGB"! :)). Anyways...these are loaded up as

either 160 x 192 x 64 color or 80 x 192 x 4096 (you heard right) color screens. VERY impressive. Now if we could only make GIFs out of THESE!! 8^)

I hope I helped a little. THe most standard ways of saving/loading Atari files is to have the 7680 (or 3840) bytes of graphics data (to be sent directly to screen memory) and then the background color (to be sent to location 712), and the 3 other pallette colors (to be sent to locations 708 thru 710).

Have fun....

BTW: I've got an APPLE][emulator for the IBM-PC. It emulates the 6502 processor and it does it perfectly. I think it would be a great idea to look at this emulator first and to see how others do it.
This emulator can be found on many FTP archives like SIMTEL par example.
If you can't find it get back on me and I'll send it to you.

4165. Atari 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-31 08:35:28 UTC
From: dam1@ra.msstate.edu
Message-ID: <1992Oct31.083528.18832@ra.msstate.edu>
Source record: 108910

I have finally decided to sell my Atari 8-bit system,
it includes the following: (this is an updated list)

Hardware - 1050 Disk Drive with US Doubler
1020 color pen plotter/printer

Accessories - 5 joysticks
1 set of paddles
1 ICD printer cable
1 ICD modem cable

Software on disk - SpartaDOS 3.2d
Bank Street Music Writer
The Converter version 1.51
Paper Clip
Print Power
The Print Shop
RAMbrandt version 2.0

Games on cartridge - Asteroids (no docs)

Games on disk - Alternate Reality - The City
Alternate Reality - The Dungeon
Artic Antics
ballblazer
Boulderdash Construction Set
Chessmaster 2000
David's Midnight Magic
F-15 Strike Eagle
Hacker
Jawbreaker
Jewels of Darkness
Leaderboard Dual Pack
Master of the Lamps
MRCA Mach 2
Pinball Construction Set
Quest of the Space Beagle (no docs)
Silicon Dreams
Tail of Beta Lyrae
Temple of Apshai Trilogy
Gateway to Apshai
Trail Blazer

Books - Basic Atari BASIC
De Re Atari
Mapping the Atari, revised version (includes XL stuff)

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: May, July, Aug/1985
May*, June, Dec*/1987
Feb, Apr, Nov*, Dec*/1988
* these issues include the disk

Except as noted, all hardware is in great condition and all software
includes documentation.

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

4166. Moving stars in Action!

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-31 08:39:01 UTC
From: Tim.Gearin@f47.n282.z1.tdkt.kksys.com
Message-ID: <720561884.F00001@tdkt.kksys.com>
Source record: 108915

Thats got to be one of the easiest things to do. Me and a friend worked on a program to do that and wh did it with DLI's instead of VCOUNT. No one ever told us how it was done either but I knew it was something simple because you see it in an aufull lot of games. I used A code block for the DLI in mine. Both me and my friend use Action too. I hav'nt yet got into any of these Action disscutions but I figured I would now.

Id also like to tell all you people who overuse the Poke() procedure to stop doing it. There are better ways. for example, defining veriables to memory locations and using Pointers and arrays are better looking and most inportantly, they are faster, probably alot faster than that damn Poke(). Also, Pointers can be used to pass many variables from one procedure to another(actually this would pass the location of the local variable table in the passing proc.) as oposed to just passing a bunch of them in the normal manner(action! will actually pass all of them) which consumes more proccesing time. I didnt explane very good how you pass vars with pointers did I? Maybe next time.

4167. What about speeding up the Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-31 15:57:36 UTC
From: Bill Mentink <U55060@uicvm.uic.edu>
Message-ID: <92305.095736U55060@uicvm.uic.edu>
Source record: 108914

Hey, I'm curous. I would guess it would be, well, a challenge. Mostly because the Atari 8 bit machines are very complex. However, I wouldn't think that its immpossible. Use one of the 65816's, you have the ROMs right there, if you wanted to really pep up the speed you use a totally different clock speed say 16Mhz. Of course the problem would be those custom chips, I doubt they could support the speed increase. How much can you speed the custom chips up and not have them fail? What about implementing an non-Atari chip and have a PLA or ROM to decode for the chip?
Has anyone tried to use the 65816 as a replacement for the 6502?

I know OLD questions, but I have just gotten a trs80 (trash ate me) and it makes me think about ideas when these machines were new. I was there, although only 11 at the time.

Bill

4169. zzzz GDESKD02.ACT

Newsgroup: comp.sys.atari.8bit
Date: 1992-10-31 21:08:11 UTC
From: phbill@cyberden.uucp
Message-ID: <cw2iTB5w165w@cyberden.uucp>
Source record: 108927

Here's GDesk demo 0.2. The main source includes procedures for making and testing buttons (3 types, normal, [RET], and [ESC] ([RET] and [ESC] would be the same as clicking them with the pointer)), moving the pointer, Print8'ing text onto the screen, Draw'ing lines, drawing Circle's, etc. No docs., nothing much in the source to tell you what it does either, but if you understand Action!, you can figure most of it out. BTW: pressing [SHIFT] + [CONTROL] + [1] or [2] will change screen and arrow modes. (there are six of each).

PS- I still need a better way of plotting the arrow on the screen. For now it moves on only a 40 x 192 grid instead of a 320 x 192 grid. Grrr..

have fun.. tell me what you think --------------------SNIP!--------

>
>--
>Bill Kendrick : PhBill@Cyberden.UUCP I like California!

Because, Bill, a lot of servers use the break signal to mean that you want to send a command to the server, and not to the computer you are connected with. For example, for me, I call a place called the Annex, from which I connect to my System 5 accout, or my NeXT account. The only way I can get back to the Annex once I'm connected to either of these... without logging out of them, is to send a break signal. to me, a VT100 is useless without this capability.

Jeff

You've just run up against Infocomm's software protection scheme.
There's a cardboard dial Gizmo included with the game (you bought it,
right?), and the game will generate some random variable and tell
you to translate it with the Gizmo, and you type in the translation.

I don't own this game so I don't have a Gizmo, but I believe there was
a doc file floating around with the translation table.

(I believe one of the random variables was animal-type)

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-01 04:14:03 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <68694@cup.portal.com>
Source record: 108917

Dilemma: Am I the only guy paying for net access? It's not just a
rhetorical question. Problem is Portal is now going to up my monthly
fees to $20/month. Thing is, I really like Portal & think it's the
best value for the money. It cost more then $20/month just to look
around anything other then E-mail on other systems. The additions they
are adding like FTP to justify the increase in fees probably cost them as
much if not more the the extra $5/month to implement, but 1) I think I
already have every file I'll ever need 2) my output is slow enough that
I'd never be missed. I'd like to not say I hate the ST sig, but I haven't
been there in months 'cause I got tired of reading flames 9 out of ten
letters. Some guy local to me is agravating for our ST BBS to go usenet &
I'm also on a local usenet node that doesn't carry alt.syst.atari.<anything>
but I'm not familiar with the system. Portal's so damm easy for some stuff
that I doubt if I'd want to go to the bother of learning a new system.
The price increase does not go into effect until Dec 1st, but I really
wonder if I should continue beyond that. The 8-bit sig here is the only
thing worth while since I'm not into alt.syst.sex.animals etc.
Well... sorry for unloading, please ignore<g>.
Rick

4173. Re: What about speeding up the Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-01 12:35:36 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.0ak0@abcd.Houghton.MI.US>
Source record: 108919

The problem with speeding up the Atari is that EVERYTHING is tied to the current bus speed. There is a reason for the oddball 1.79MHz speed. It is the same as the composite video refresh rate.

The 6502 puts data into memory, and during the vertical blank, the ANTIC picks it up and puts out a picture through GTIA. To mess with the bus speed, you would have to have some exact multiple of the current bus speed, run two clocks (one for the 6502 and the other for the ANTIC & GTIA), plus have some means of synchronizing them so they don't overlap with memory access.

This is where not having dedicated video memory becomes a liability rather than an asset.

The better means would be to keep the same bus speed, but put in a more efficient CPU that can execute 6502 instructions with fewer clock ticks. I don't know if the 65816 can do that or not.

4174. Re: (how much do you pay for net access?)

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-01 12:43:49 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.0ak2@abcd.Houghton.MI.US>
Source record: 108920

In answer to the earlier question, I pay nothing for net access -
The SYSOP of a local BBS pays the cost of tieing into the net, and gives
users of his BBS free access to the newsgroups that he supports. (a lot,
but the point is, he selects which newsgroups are on his board.)
Anyone can respond to a newsgroup message or enter a new one. But EMAIL
access is limited, and there is no FTP access.

To get any better access than the above could cost me plenty.

4175. Trying to get a working term prg

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-01 16:06:51 UTC
From: pbhoeffl@undergrad.math.waterloo.edu
Message-ID: <Bx1orH.8qK@undergrad.math.waterloo.edu>
Source record: 108921

A cheery November to you all!

For several days now, I've been trying various terminal programs from the archive, but I can't get any of them to work.

I've tried Bobterm 1.2, but it just crashes upon loading. Basic on or off, it crashes. Most of the others will run, but won't work because I don't have an RS232 handler loaded. Well, I don't have one, and all these prgs seem to think I should.

There is a file 'xm301.doc' which purports to contain a T: driver, but the file is truncated around mid-Section-2. Lotsa help.

I'm using an 800XL with an XM301 modem (and a Rana 1000, if that makes any difference). Could somebody offer some pointers on what I might be doing wrong, or what I need to get this working?

Email or posts, all are appreciated.

Message-ID: <1992Nov1.205658.14895@news.ysu.edu>
Source record: 108922

I'm wondering if anyone might kow if Turbofile (from MicroMiser software), is still available. Turbofile is (was) a database program that is apparently easy to adapt to Hard Drive systems..

Or, is it possible that someone who has it is willing to part with their copy???

I have a record-keeping problem that I ☐{would like to solve with my 8-bit..I seriously don't want to have to use an IBM..(all my buddies would say: "I told you so!")..and you know how irritating that can be for an 8-bitter!

Thanks...

>to either of these... without logging out of them, is to send a break
>signal. to me, a VT100 is useless without this capability.

The same is true for me... Although I connect to a decserver. So
breaks are definately necessary. Even though I dont use my 8bit as much
anymore with have an STe and a unix pc.

Message-ID: <1d1m28INNasd@usenet.INS.CWRU.Edu>
Source record: 108924

```
The 8-bit Atari
Frequently-Asked Questions List
for the Internet

Posted on or about the first of the month, simultaneously to:

comp.sys.atari.8bit and the Info-Atari8 Digest
------------------ -----------------
(the Usenet newsgroup) (the Internet mail-list)

which are, in fact, one and the same group.

Revised 1-Nov-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All postings to comp.sys.atari.8bit automatically appear in the
Internet's Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All contributions to the Info-Atari8 Digest automatically appear
on Usenet's comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning,
jrd@atari.archive.umich.edu.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu
(141.211.182.23), login as "anonymous" and type in your e-mail address as your
password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is
```

your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This can be useful for UUCP and other addresses that BART may not be able to figure out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.182.23), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/New". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should only be posted to the discussion group as a last resort.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/Zmag directory, in filenames

such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.

820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

End of FAQ list.

Hmm... BobTerm crashes on your 800xl? What DOS are you using? It should work just fine with MyDOS and Atari DOS, but I'm not sure about Sparta (either version). I'm not sure what handler you need with the XM modem, but I'm pretty positive that most terminal software out there requires an "R:" handler, not a "T:" handler. I use the BobVerter (and sometime othe assorted R: Handlers) and it works just fine with my SX212. I'd think there'd be a copy of almost all of the handlers up at the archive.. hmm...

have fun! :) (btw: 300 baud? oooh.. couldn't find a better modem, eh? ;) SX212's go for $25-35! :))

Bobterm is a fine program, and it always worked for me, way back when I was using an XM-301 modem. But you need a modem handler. The Bobterm.arc file should contain a file called XM.COM; you rename it to RS232.COM. Assuming you've done that and it still crashes, what else is connected to your computer? The XM301 draws power from the SIO bus, and there could be problems if you have other interfaces that also get power from the computer.

Bill Marcum bmarcum@world.std.com

As a follow up to what was said about ATARI 8-BIT picture formats...

I know of a program to convert standard Micro-Illustrator, Micro-Painter, ".PIC" files to ".RLE" (Run Length Encoded) files called: RLEMAKER . RLE MAKER is part of the RSCOPE/RLEVIEW RLE terminal program. (Does anyone have the online "help" file for this program ? In every version that I have downloaded this file is missing.) NOTE: Micro-Illustrator/Micro-Painter is considered a "standard ATARI graphics dump" and there are many ATARI programs which can read this format.

There is also a program to read MAC-PAINT format Apple Macintosh pictures on the ATARI 8-bit called: MACREAD . The ATARI 8-bit version of MACREAD is not quite as good as the C64 version of MACREAD, in that it doesn't allow for realtime scrolling of the MAC-PAINT image, but the program is quite servicable.

The ST picture format viewer that I have is called: DEGASVU . As far as I know, DEGASVU can only read ".PI1" class DEGAS format pictures. I don't have any ".PI1" class DEGAS pictures. All of the DEGAS pictures on BBSes I see are in either TINY format or ".PI3".

The two ATARI 8-bit programs that I know deal with ".GIF" are called: AT8GIF and GIFNCODE . There may be others, as well.

I haven't seen APACVIEW, the APAC picture viewer, on any of the BBSes near Boston, Massachusetts, although I have seen Color View. (Strange....)

I've done that renaming thing, but it doesn't seem to get to a part where it
actually loads it up (disk drive has a track display). I have nothing else
attached to the serial bus, and the modem seems to power up just fine.

Is it possible the version I ftp'd from the archive could be flawed?
(bterm12.arc). I doubt this, but might the Rana 1000 (i.e. 3rd party) drive
be interfering in some way?

Well, APAC>View< is a GIF loader, while APAC>Load< is simply an APAC
loader. I'm not sure if any version of APACLoad can handle interlaced
APAC (.ILC & .PZM (PryZm)).. Jeff? Any comments? :)

4187. Digi-Studio sell-off

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-03 13:24:03 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Nov3.132403.11250@aber.ac.uk>
Source record: 108934

Well, it looks like I have a distributor for Digi-Studio in the US. The price of Digi-Studio in the US will be $29.95. This will include a 50+ page manual and at least 2 disks. It is at the discretion of the distributor whether the asking price includes shipping, but I think it will.

This new version of Digi-Studio gets released in the UK on 14th November. It will be available in the US about 2 weeks later.

I will release the name and address of the distributor when it gets nearer the time, just in case there are any last minute problems.

Because the new version is coming out, I need to clear out all remaining copies of the "old" packages 1 and 1.5. You should all have the info on these already (I sent enough copies out on the net!!). I don't have many copies left, so it's first come, first served. Here's what's left with the new prices:

Package 1 and 1.5 packs - 2 manuals, 2 disks. 20 copies left.
UK price 4pounds, US price $10

Package 1.5 only - 1 manual, 1 disk. 10 copies left.
UK price 2pounds, US price $5

These US prices INCLUDE shipping from the UK. You can pay in cash in US$. Just write your name and address on a piece of paper, put in the right amount of cash and send it direct to me at the address below. These packs will also be offered in the UK, so you may like to email me to reserve copies before sending your order. You may like to register your letter at the post office, which costs $3. But, we're only talking about a few dollars here, so you probably don't want to bother! Send orders to:

DEAN GARRAGHTY
(DIGI SELL-OFF)
23 YSTWYTH CLOSE
PENPARCAU
ABERYSTWYTH
WALES, UK
SY23 3RU

EMAIL: djg0@aber.ac.uk.

Dean Garraghty.

4188. Xformer

I got the 8-Bit emulator for the ST (ST Xformer 2.55 - stxf255.lzh) from aa.
I hope there is someone who can answer two questions:

- Only 15 text-lines are displayed - is this a program-error or just
wrong pre-setting?

- Does te offer for the user's manual include europe (germany)?

Thanks in advance

Rudolf.

Bret,

I used to have a Rana 1000, and I really can't think of a way that the drive could possibly be interfering with communications to/from your modem. Does the XM301 have a built-in mini-terminal program like the 1030 did? Perhaps you could try jumping into that to see in the XM301 is even operating properly.

Which DOS do you use, is it SmartDOS? That is the DOS that came with the Rana1000. Perhaps the DOS is causing problems.

Jeff McWilliams

Message-ID: <Bx75tv.9v0@undergrad.math.waterloo.edu>
Source record: 108940

Well, more and more, the trail seems to lead to DOS. I've tried using MYDOS 3.013, and SpartaDOS 2.3 (not a typo), and Atari DOS 2.6f, all with identical results. The modem is currently borrowed from a co-workers dusty basement, and hence has no documentation. Frankly, I'm a bit spoiled and find 300 baud repulsive :-), but for the moment I'd like to get it working.

With respect to other terminals, GTERM boots just fine, but then gives a $82 error, because there's no R: device. Maybe I'm just dense (and I'm quite willing to entertain the possibility!), but I can only find one R: handler at the archive, namely atarirs.arc, and it doesn't seem to solve any of my problems either.

Hloe!

I'm selling my Atari system. Included:
Atari 800XL w/ 256K Newell
1050 w/ US Doubler
ISD Basic XE
SpartaDox 3.2d
Mapping the Atari
(several other atari books)
Okimate 10 w/ atari interface
MPP expansion card
Supra 300 modem
Lots of PD software
Several years of Antic, Analog.
(Analog collection starts w/
number 5)
A bunch of other hardware (mouse,
Parrot sampler, speech synthesiser).

Make me an offer. No COD. Your offer should include
shipping (about $15 - consider the magazines).

finally, a place where the 8bitters can converse.

Does anyone know of any possible enhancements to diamond gos?
I bought it a few years back and got like no support from
alan reeve. The guy took my money and never sent me what I ordered.
He says that he has no record of it, and when I talked to him a few months
back, he has completely abandoned us. oh well...

I have another question. Would anyone be interested in a new comercial
quality text game? I work a lot with macs here at sonoma state(in california)
and I was thinking of developing a text like game on it to sell. But
if there is enough demand for the thing, I will develop it on the 8bit
and I will then port it over to the bigger machines. if you can,
give me feedback on the idea. My Email address is:
brownan@vax.sonoma.edu I think. If not, reply to the message.

another thing. Is there anyone out there that has an amdeck 600 color monitor?
One of my fraternity brothers gave me a working one, but I just can't seem
to find the specs to the pinouts of the monitor so that I can make a
cable for it. Any help with this would be appreciated.

finally, is there a vt-100 emulator that has uploading/downloading capabilities?
I have the vt-10^2 and it works decently with the exception that it doesn't
u/l or d/l, and after a few minutes, while using it, it doesn't scoll once
the bottom line of the screen is accessed, leaving me with something like
a printer when the paper is stuck. It keeps writing over things.

It is from antic magazine.

thanx alot
anthony brown

4196. SX212 & Homewriter 10 Printer ?'s

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-05 19:34:57 UTC
From: niceswangern@bvc.edu
Message-ID: <1992Nov5.143458.2603@bvc.edu>
Source record: 108944

Hello,

This is my first post to this newsgroup. I have an Atari 800XL at
home that I used to use A LOT, but once I got into high school and college,
I didn't get much time to use it. I still get a few catalogs from certain
companies, though. The other day I noticed that B&C is selling the SX212
modem for $30.
My question is : If I buy the "SX-Express Modem Software Package",
will this be the only extra thing I'll need to buy to use this modem?
Also, what are the costs nowadays for using the modem [subscribing to
certain services, etc.]?

Another unrelated question ... A long time ago I bought an Epson
Homewriter-10 printer and hooked it up to my 1050 disk drive with an Epson
Interface (Part #8692AA). Everything has worked fine on it, except for the
fact that it won't print ANY graphics whatsoever. I have several programs
like Cardware and such, as well as lots of pictures from AtariArtist that
I'd like to print, but can't. Would a new interface help the problem?
(This printer does support graphics, by the way.) Maybe the ICD printer
cable will work?
Well, that's enuff questions. I'd appreciate ANY responses.
Either e-mail them here or just post them. Thanks a kazillion.

>CTIA which was succeeded by the GTIA in early 1982. Why was the GTIA
>better, and what could it do that the CTIA could not?
>Eric
>

As far as I know what GTIA provides is 3 new graphics modes (9, 10, and 11 from BASIC). One is 16 shades of 1 color, one is 16 colors of the same brighness, and one is a mix, 8 colors/brightness - all in a resolution somehwhere between gr.7 and gr.8. Does GTIA add anything else?

(Note I've cross-posted this to comp.sys.atari.8bit, where the 8-bit Atari experts are.)

Nate,

Not to put down the distributors who sell modem software, as for a lot of people it's the only way they can get ahold of the stuff... but... the best modem software for your Atari is shareware, excluding the Express! cartridge. I haven't seen or used that product, I stand strongly by Bobterm for general communications, and Omnicom for vt100 capability. Bobterm should be the only thing you need for connecting to BBS systems, Compuserve, GEnie, Delphi, etc. I suggest a VT100 program like Kermit 65 or Omnicom if you want to dial into your school's mainframe.

Regarding your printer, is the port on the printer itself the standard centronics connector, or something different? If this model you have has some proprietary connector, you may be stuck with the interface cable Epson sold to you. I believe this was the case with the Big Blue printer, wasn't it?

Jeff McWilliams

Message-ID: <1992Nov6.070410.28819@cs.tulane.edu>
Source record: 108952

I don't know if there is any interest but, I just received from Tom Hunt
of Closer To Home BBS a version of TurboBasic that will load and run
with SpartaDos 3.2d (or any of the patched versions that are out there).

This version will run just as fast as the current version (1.5) however,
this version can not be compiled. From what I've been told, if a program
is compiled using Compiler.com, it uses the ram under Dos and causes
Sparta 3.2d to lock up.

Now, Tom is looking for the Source code for TurboBasic 1.5XL if it is
out there. What he wants to do is patch it to work with any dos.
If anyone knows where it can be found or if you have a copy of the source
code, plese send me a copy so I can get it to Tom.

Thanks

Mike

From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.0apt@abcd.Houghton.MI.US>
Source record: 108948

You cannot connect a SX212 to an Atari 8bit right out of the box. Like most modems, no cable is included. The Express! SX package comes with an Atari SIO cable and a slightly modified version of Keith Ledbetter's Express! 3.0 (Atari hired Keith to do the modifications) and Atari's handler for the SX212.

There is nothing wrong with this package. It is a competent comm program.

However, if you already have an extra SIO cable, and a copy of either Express! 3.0 or BobTerm (for those of you who have forgotten, neither of these programs is in the public domain, and the authors would welcome a couple bucks for their efforts!), you really won't gain a thing by purchasing the Atari package.

The problem may be(I addition to others<g>) Atari in their infinite wisdom decided that since an 850 interface is an "R:" device, a modem well be a "T:" (for telephone) device ergo some stuff that looks for a "R:" will get confused by only having a "T:" there. Ditto for stuff looking for a "T:" & finding a "R:". I just checked my handler & it's 2.5k so typing it in is out of the question. Where are you & how are you currently getting the programs to the Atari (my VP impression)? If you send me your address, I could probably mail you a copy of the thing.

A while back there was a lot of talk of a command line proc for Dos2.5
and compat's. While looking through the WBUG files today, I found a
copy of BBKCP. It does seem to work with Dos 2.5 and Mydos, gives the
feel of a low grade SpartaDos. If anyone is still interested, I've sent
it to the archives at Umich. Also, I've sent the latest version of
ApacView, 2.4 dated 10/92 to the archives.

And as always, if you can7t get the file from the archive, drop me a note
and I'll eithe e-mail you a copy or send a copy USPS....

Also, I checked GEnie for the source code for Xformer... There are a number
of write up7s about the program, however, no source code.

>PC (I still have my 130XE) and I want to be able to use my hundreds of atari
>programs/games on my PC.

As I understand it, there was one written, but it was never released
due to legal difficulties with the OS code. Not sure if it was
completed, or just being developed.

>Also, can anybody point me to a ftp site where to find a program that could
>let me read atari disks on the PC?

atari.archive.umich.edu is the site for 8bit stuff, in atari/8bit
directory. It's also mirrored on wuarchive.wustl.edu, I forget
which dir. There are several programs on the archive which will
allow you to read and possibly write atari *double density* disks
on the PC. I think the FAQ has descriptions of these (??)

hope that helps.

4209. Latest version of MyDos?

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-07 17:59:21 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.721159161@vincent2.iastate.edu>
Source record: 109015

does anyone know what the latest version of Mydos is?
I have 4.50, and I tried to compile 4.51 from the archive,
but it didn't work (it tries to access device $12 on the
serial bus?).

I've seen 4.53 mentioned, and also versions that work with
atariwriter. Where can I get these? Also, what differences
are there from 4.50?

thanks.

IMHO: You'd need more then luck to make any money on a text only game in any market. Infocom did great games & is no more. Not that they wouldn't be appreiciated, just not paid for.
I've got an Amdek 710, it's a IBM CGA monitor & I'd bet the 600 is either a IBM CGA or mono monitor=>can't be hooked up to Atari.

4211. Re: SX212 & Homewriter 10 Printer ?'s

The pack will have everything you need cause the SX will either direct connect to the serial cable or to a standard serial cable like found on an IBM or ST. Good choice for a modem if you don't mind 1200 baud in exchange for something that can be used with anything.
How are you hooking the Epson to a 1050??? Anyway, most people use an 850 or P:R: connection from ICD for hooking up printers. Most of the software for doing printer graphics expects one of these devices to be hooked up. They are a little pricey still so....
No DATA on VT-100.

4212. PIC (atari) format ---> BMP (pc) format????

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-07 21:19:01 UTC
From: jleon@usc.edu
Message-ID: <1dhbs5INNhmh@phakt.usc.edu>
Source record: 109008

Hi everyone, can anybody tell me if there's a program which can convert a .PIC atari graphic file to a .BMP (or .PCX or whatever) pc graphic file? I have some PIC files that I want to see and I left my atari at home when I came here to study. Now I just have access to pc computers.
I did some experiments when I was at home and it seems that both formats are in some way similar.

Thanks

Juan Leon.

4213. Comments on XE/XL memory upgrade?

Newsgroup: comp.sys.atari.8bit

Hi again!
I've found on the atari ftp site two files about upgrading the memory
in a XL or XE machine (addmema.arc & addmemb.arc) and I was thinking
in doing one of this upgrades.
Can anybody give me some comments about this? I have a 800XL and a
130XE at home, is it better to upgrade the XE? or the XL? I mean which one
will handle the upgrade smoothier. Is there really an advantage in doing this?

I will apreciate any response.

Juan Leon.

>will this be the only extra thing I'll need to buy to use this modem?

You actually don't need to buy SX Express to use the modem! A sharware
program called BobTerm supports the SX212 modem.

>Also, what are the costs nowadays for using the modem [subscribing to
>certain services, etc.]?

The best sources for Atari 8-bit services are local BBSes. If you want
to subscribe to one of the national networks (such as GEnie, CompuServe,
etc), you will be paying at least $5 a month just for having an account
on one of these systems, plus an hourly fee ranging from $6 to $13.

> Another unrelated question ... A long time ago I bought an Epson
>Homewriter-10 printer and hooked it up to my 1050 disk drive with an Epson
>Interface (Part #8692AA). Everything has worked fine on it, except for the
>fact that it won't print ANY graphics whatsoever. I have several programs

>I'd like to print, but can't. Would a new interface help the problem?
>(This printer does support graphics, by the way.) Maybe the ICD printer
>cable will work?

If this printer is identical to the Epson LX-90 I used to own, which
required the owner to purchase a cartridge that plugged into the printer
and provided the necessary interface, then you need a different
cartridge. The Atari interface cartridge for that printer emulates a
1025. To do graphics, you need the IBM cartridge. Good luck finding
one, however. They are VERY difficult to locate. It may actually be
cheaper for you to buy a used printer with a standard Centronics
interface. Oh yeah, you will need something like an 850, P:R
Connection, or some other printer interface to hook up a standard
Centronics printer to your 8-bit.

4215. RMBOOT3A

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-07 23:01:24 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1dhhs4INNi95@usenet.INS.CWRU.Edu>
Source record: 109014

Don LeBow over on CIS (76704.41@compuserve.com) sent me an updated RAMBOOT3 file for use with MYDOS. I uploaded both RMBOOT3A.AUT and RMBOOT3A.DOC to the atari.archive.

Here is RMBOOT3A.DOC:
==========
This is a fixed version of the RAMBOOT3 file that's distributed with the official release archive of MYDOS v4.50. The program initializes the RAMDISK, copies DUP.SYS and MEM.SAV to it, then finishes by copying any files it finds in a subdirectory named RAMDISK.

Due to a transcription error in the source code, the copy routines work much slower than they should. If you've been using this program and have been wondering why it takes so long, then try this one. Rename RMBOOT3A.AUT to AUTORUN.SYS (or whatever you need for a Bootfile name.)

Following is the section of code from the original RAMBOOT3.M65 that has been changed:

```
3540 ;COPY DUP.SYS FROM D1: TO D8:
3550 ;
3560 COPIES LDX #$30
3570 LDA #12
3580 STA ICMD,X
3590 JSR CIOV
3600 JSR CLOSIT
3610 SEC
3620 LDA MEMTOP
3630 SBC #BSS&255
3640 STA BUFLEN
3650 LDA MEMTOP+1
3660 SBC #BSS/256
3661 ;bug fix!
3662 ;following was STA BUFLEN
3670 STA BUFLEN+1
```

Hope you find this useful.

From: phbill@cyberden.uucp
Message-ID: <XsFwTB1w165w@cyberden.uucp>
Source record: 109018

I have v.'s 4.53/3 and 4.53/4 (those are right, right?). The "/3" and "/4" tell how many digits are listed for file size. I may one day decide to switch to "/3" (I started my MyDOS life with the "/4" version, and just lately got a hold of "/3") because it'd be more compatible with programs like AtariWriter (that way I could see how big files are, not just CLOSE to how big they are). BTW: I've never had problems booting MyDOS and then binary loading "AUTORUN.SYS" on the AtariWriter+ disk (or did you mention a patch for AtariWriter? (the cart. one) (is there a cart. version of AW+ as well?))

Anyways... have fun. also, look for "MyNI_DOS", my MyDOS CLI... it's still in the works though.

Source record: 109019

Well, if you know how to load the PIC files correctly (the extenders have gotten all confused in the past 10 years..), it would SEEM that BMPs'd be easy to make. The two types of ".PIC"s I know of are standard memory dumps (dumping 7680 bytes of screen memory straight to the disk, and then added the 4 color register values.. this is for a Graphics 15 (aka 7.5 and 7+) screen), and the "Koala" style, compressed, files.

I guess it'd be a good idea to bug IBM gurus on the format of BMP files...

In November, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a Library Night.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the November issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, November 11, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Monkey Wrench II goes in the right slot so it can be used with the ATARI
BASIC Cartridge (I have one and used to use it extensively in the early 80's).

I also have a cartridge called "Magic Dump" which goes in the right slot.
It is a screen dump utility.

The SIO2PC device is a combination of hardware and software that allows a
PC to pretend to be a physical Atari drive. The Atari's SIO signals are
translated into RS232 signals by the hardware device, and the PC software
interprets these signals and responds in such a way as to emulate an Atari
drive (or printer). Unfortunatley, the PC software is (I believe) written
in assembly and is not publicly available, making it rather difficult to
port.

Theoretically, however, the device should work with any computer that can
send and receive RS232 signals. [I don't know about Mac's--don't they use
RS432? Does this matter?] The issue is writing the software for the
server machine to interpret the signals. If you are interested in writing
such software, I would suggest contacting Nick Kennedy, the creator of SIO2PC,
and asking for a copy of the PC code and any suggestions he may have.
Also, I beleive that others have done some work on writing their own software
for SIO2PC. If their code is in C, it should be much easier to port.

Good luck.

I thought Monkey Wrench II was the XL/XE compatible version, and since the right slot doesn't exist on these machines, I don't see how that could be... Anyway, MW II was '85 or '86 (you DID say EARLY 80's...) Of course, I could be wrong. NOT! :)

Source record: 109039

I must thank RIck Cortese for help with pointer movement on GDesk. It moves SMOOTHLY now! WOW! It's great. Instead of jumping 8-pixels when it moves left and right, it moves ONE PIXEL AT A TIME. I didn't directly import the source you sent me though Rick. I did take it's concept (using the RSHift, LSHift operators at move the bits.. I knew I'd have to use those, but how was another story..) Perhaps I could even write a new Print8 (ok, update the old one) which will be able to position text anywhere on the screen, not just on the Graphics 0-like 40 x 23 grid.

NOW, however, I have a very STRANGE problem. I have a clock display at the upper right of the screen on GDesk, and when you point to the rightmost upper corner of the screen, the clock changes modes (time, time set, date (set), and off). When it's in time set or date (set) modes, you click the numbers to advance them by one, BUT.. the numbers just jump all over the place.. I decided "ok, maybe it's a problem with how I store it in the string I use to display it with the Print8() procedure, I'll print the values to the printer every time they change"... guess what, not only do the numbers on the printout come out correctly (how I WANT it to), but so does the time on the screen!.. so I decided "alright, I'll turn the PrintBD() calls (that you use to print to device (in this case, printer)) into remarks, and it should work right"...

guess what? same thing as before.. the numbers jump around strangely.. since I'm using BYTEs, it's a little harded to see what the pattern is with the clock, but the thing SHOULD be working right... I asked a computer expert (not w/ Ataris or Action!, though) what she thought (actually, I was just mentioning this bug-from-hell that I found (made?)) and she said it probably had to do with the fact that the printer slows down the system.. it might be that when I press the button to advance the number on the clock that it keeps advancing (and wrapping at 256 back to 0, since they're bytes) until I let go (which can be 10s of times in a fraction of a second), but it has checks to wrap at time limits (12 hours, 59 minutes & seconds)... also, the same bug happens with my date (set) mode...

anyone have any ideas!? is this confusing or WHAT?!

thanx in advance.. perplexed,

I've got a copy of the source in assembly, but I don't know if the
author wants it distributed. I really like the sio2pc, but to be
honest, the code isn't the greatest. It would probably be easier to
rewrite from scratch, though I suppose it'd be a place to start.

>Theoretically, however, the device should work with any computer that can
>send and receive RS232 signals. [I don't know about Mac's--don't they use
>RS432? Does this matter?] The issue is writing the software for the

>and asking for a copy of the PC code and any suggestions he may have.
>Also, I beleive that others have done some work on writing their own software
>for SIO2PC. If their code is in C, it should be much easier to port.

I've looked at how its done, and it isn't really that difficult.
There are 4 lines coming from the interface: data out and data in
(which are just going to the serial chip), the command line, and an
enable. The trick is getting the timing right. The hardware ref.
manual has enough info for that. If the mac has a standard rs232
port, it should be possible. If not, you could also try using the
printer port. This wouldn't require as much interface hardware, but
the programming would be more difficult. You'd need to do the UART
function in software, and timing could be tricky.

I don't have a mac, but if someone wants to give it a try, drop me
some email. You might also ask the author of AFS, which is the
program Preston mentioned above. I don't recall who it is, but I
believe it is in C.

SIO2PC is in the public domain (or maybe it's shareware).
It's available via anonymous FTP from atari archive (the
exact address escapes me right now).

It's been much improved and I believe the source code
comes w/ it. If not, disassembly shouldn't be too much
of a problem.

I'm selling my Atari 800Xl system. It includes:
800XL w/ Newell FastChip and Rambo 256K
1050 w/ US Doubler
Okimate 10 color printer (w/ atari interface)
Supra 300 baud modem
AtariArtist cart and drawing tablet
speech synthesizer
Parrot sampler
MPP expansion/experimenter's card
Lots of PD software
Atari-to-parallel converter
lots back issues of Antic and Analog (analog back to #5)

E-mail me an offer! Get this out of my house! No COD!

David Anderson

Last I heard, Nick Kennedy wasn't very excited about people looking at his source. I think that's what the documentation says. Anyway, if you want the source, I think you need to contact him.

Disassembly is a big problem if you don't have a PC. The assembly code is 8088 assembly, not 6502, so the person looking to port the software to another platform has a real challenge. And for most programmers, the idea of porting an assembly language program isn't very exciting. I would suspect that most would find re-writing it in C would be the best bet. What is really needed is a list of the signals that the RS232 port needs to read and send, along with information on necessary delays.

I can't speak for VisiCalc, but if you own a one meg MIO, and if the
application is not copyprotected, you can use DiskCom to put an image of
the bootable disk on a ramdisk. Swap the MIO ramdisk to drive 1, and
reboot.

I kept DiskCom versions of PaperClip, MYDOS, etc. on my SpartaDOS formatted
harddrive. When I wanted to use one of these non-SpartaDOS compatible
applications, I simply called a batch file which setup the ramdisk*,
swapped the ramdisk to drive 1, and rebooted. Coming from the harddrive to
the ramdisk only took a minute or so (typically less time than booting from
floppy), and the applications performed all disk accesses like a streak of
lightning. When I was done, I reset back to the MIO configuration and
swapped drives to their normal positions.

*NOTE: I ran my MIO constantly from a trickle charged battery. I never
lost the RAM contents or reset the MIO in two plus years. I kept one
ramdisk floppy sized to do the above tricks. If you don't keep a floppy
sized ramdisk at all times, you will have to rebuild (and reload) your MIO
configuration each time you want to use it for the above.

GTIA also reversed the artifacting of GR8 mode..... it reversed the color effects of odd/even pixels... This will affect colors in games such as Hard Hat Mack (which I'm not sure was written for CTIA or GTIA artifacting).

Other than that, I think that is the extent of the changes... If I'm wrong someone correct me....

Subject: HomeWriter-10 Printer

Trying to answer this question takes me back a few years, I hope the cobwebs
don't get in the way. The HomeWriter-10 printer was made by Epson & was- I
THOUGHT- a custom-modified version of the LX-80 but with a built-in interface
for certain computers. My impression was that the HW-10 was the one with an
built-in interface for the C-64, but I can't swear to that. A great deal of
confusion is possible here because Epson marketed this printer in 1984-1986 in
a wide variety of configurations & manufacturing changes with at least 4 dif-
ferent model names for basically the same printer. And just to make matters
more muddy, Epson also marketed a line of interfaces for various 8bit home
computers, including the Atari 8bits. These interfaces were known as PICs
(Printer Interface Cartridge). I never saw a review of the Epson PIC for
the Atari 8bits.

The LX-80/HomeWriter-10 was the first Epson 9-pin to have NLQ output. And yes,
it is also graphics-capable. If the printer chokes on graphics, either a DIP
switch may need to be turned on inside the printer to put it in graphics mode,
or else the problem is in the interface. There was at least one third-party
interface (Ape-face???) that had the same problem.
```

If you are using one of the Epson interfaces (either a PIC or a built-in interface), I'd bet even money the graphics problems will go away with an 850 or a P:R:Connection. Hrrumph, even the parallel port on the XEP-80 won't do or a P:R:Connection.
or a P:R:Connection.

Whoops, got a little technical problem here....

It may well be the Epson interface was a text interface only. Many of the early interfaces were like that, especially since the earlier models of Epson printers were mostly text printers which required a Graftrax upgrade to do graphics. Some interfaces couldn't recognize Graftrax. With the LX-80/ HomeWriter-10, Graftrax was built-in (another of the advanced features of that printer for its day).

Just my $.02.

>sphincter. I argued that he wasn't, I was wrong. I still have to get
>back to that guy & admit he was right.

The source code he gave out was for a much older version. No I
haven't actually seen it myself. I tried to get source code from
Darek at one point and although he didn't tell me I was an anal
sphincter, he did his best to try to make me feel like one.
(Basically he said that Xformer was as good as it could ever be, and
could not be improved, therefore morons like me who thought they could
improve it weren't worth the 15 minutes it would take him to upload
the code.)

To anyone trying to get source for Xformer, or anything else, from
Darek...don't waste your time.

Cheers,

4242. Atari Emulator for PC minus ROM's

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-11 03:43:33 UTC
From: gt8741b@prism.gatech.edu
Message-ID: <1992Nov11.034333.29522@riacs.edu>
Source record: 109040

I know, this gets asked a lot, and I have seen the answer that because of legal reasons, an emulator can't be released. How about releasing one that requires the operating system to be stored in a disk file? I own two old Atari's: a 400 and an 800XL, and I have several things on them that still pass what I can get on a PC (games, Games, GAMES). An emulator could be released that emulated the hardware and the chip, but the user has to supply the operating system. That's how some of the old Translator Disks worked, especially the Analog one. You had to copy the old operating system to a disk. I think that this would be legal. I own an HP 48SX calculator, and when someone wrote an emulator for it, that's how they did it. I have a copy of my ROM's in a disk file.

If someone could at least tell me the name and email address of the author, I might try to contact him. Thanks!

4244. Clock...fixed

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-11 04:21:00 UTC
From: phbill@cyberden.uucp
Message-ID: <PL52TB5w165w@cyberden.uucp>
Source record: 109050

I successfully fixed my GDesk clock. Ugh.. it was a problem with time advancing too much when you held down the fire/return button. So I just had it advance once, and wait until you release it. Also, the time was NOT checked when advanced manually.. That's because I had the program set up like this:

```
If Sec>60 Then Sec==-60 Min==+1
If Min>60 Then Min==-60 Hour==+1
If Hour>12 ...
```

etc. Not like this:

```
IF Sec>60 Then Sec==-60 Min==+1 Fi
If Min>60 Then Min==-60 Hour==+1 Fi
```

etc. oops.. So I edited the if-fi checking of the time and stuck it in a place other than when the internal clock has changed (out of the "If Clock>1 Then Sec==+Clock ..etc." part of the procedure).

Also, I fixed manual clock advancement so you can go "+" or "-" (clicking the left or right digit of the number).. and that's just version 1.0 of the clock! :) A later upgrade of it will include an alarm, possibly a "day of week" calculator, and (if someone gives me the code) might be set from the RTime8 instead of manual each time you load it.. cool, eh!?

>Hard Hat Mack (which I'm not sure was written for CTIA or GTIA artifacting).

One last bit of trivia. I believe the GTIA handled collisions between
players and text characters differently than the CTIA. The CTIA allowed
a collision between a (gr.0) text character and a player, but not
the GTIA. Or maybe it was reversed.

I read this in "COMPUTE!" magazine long ago, in the "Insight: Atari"
column. There was a brief program listing included that put a player
on screen and tested to see if a collision was detected or not with
some text characters printed on the screen. Based on the results of
the collision test, it printed whether you had a GTIA or CTIA.

Amazing what useless bits of trivia the mind can remember, isn't it?

Can someone direct me to the FAQ for this newsgroup? I couldn't find it archived anywhere. I am assuming that there is a FAQ. Am I right? ;->

4247. Problems at atari.archive.umich.edu

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-11 18:00:11 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1drhnbINN63g@terminator.rs.itd.umich.edu>
Source record: 109044
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Here's a list of known problems that I (we) are working on to
remedy:

1. There's no files in Applications/Perutls, Applications/Math,
Applications/Wordproc or Applications/Spreadsheets. That was a
result of having to ftp everything over. I just forgot about 'em.

2. There's very few editors in Editors. Similar problem to
the above.

3. On occasion, you'll get server not responding errors. This is
because there was an air conditioner problem in the machine room. I
think this is all better now.

4. Bart doesn't work. We're still looking for a host machine for
it to run on.

5. I've been particularly angry at people posting questions about
the archive to comp.sys.atari.st. This is because the problem
reports should be going to me, not the world, who can't do much
about it.

6. On occasion, particular volumes in the archive won't be working.
I don't know why this happens, other than the fact that each
root level directory is mounted on a separate disk. It is
possible that each of the disks could go down for backup individually
from time to time. (Along with other possibilities I haven't even
dreamed of yet).

In short, this is a new experience for me too. I'd appreciate people
letting me know, by mail, of any and all problems that they
have. I'll try to remedy them as best as my schedule and
physical location (I'm 700 miles away from umich now) will permit.

Jeff

4248. Atari 800 keyboards

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-11 18:05:15 UTC
From: carl@eagle.wesleyan.edu
Message-ID: <carl.3@eagle.wesleyan.edu>
Source record: 109045

Does anyone have any Atari 800 computers collecting dust that they would like to get rid of. I need some keyboards for these antiques. These are different than the Atari 800xl computer.

Thanks
Dave

4249. Re: Writing Atari disks on IBM PC's

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-11 18:17:12 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <69304@cup.portal.com>
Source record: 109046

If don't get any better offers, I can send you a disk in double density format with an older version of Mydos along with some utilities. I could discomm a standard Atari DOS 2.5 & put it on the same disk with some utilities. I'm getting a little better on my I/O. It's only taking me a month or two to get stuff out now<g>.

After following the combat in rec.music.synth et al.... I've come to realize that we rarely provide ata-persons here....

I just wanted to thank Jeff for running Atari Archive. Problems happen (see, can say it without offending anyone:-). For a free service, I think it is great. I'm glad there are people willing to stick their nose in and do something when it is needed.

So, I hope everyone will try to have a positive tone as Jeff works through the changes at Atari Archive (remember when it appeared that AA would disappear early in the year....) and remember that he is performing a service to our community.

Thanks Jeff! Have fun! - Bob

The 8-bit Atari
Frequently-Asked Questions List
for the Internet

Posted on or about the first of the month, simultaneously to:

comp.sys.atari.8bit and the Info-Atari8 Digest
------------------ ------------------
(the Usenet newsgroup) (the Internet mail-list)

which are, in fact, one and the same group.

Revised 1-Nov-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All postings to comp.sys.atari.8bit automatically appear in the
Internet's Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All contributions to the Info-Atari8 Digest automatically appear
on Usenet's comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@atari.archive.umich.edu.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.182.23), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This can be useful for UUCP and other addresses that BART may not be able to figure out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.182.23), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/New". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should

only be posted to the discussion group as a last resort.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/Zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What magazines support the 8-bit Atari?

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers
which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that
is common in the IBM-PC/MS-DOS world. This is done to make the file shorter,
so it takes less time to transfer between computers. The atari.archive
contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion
program is called superarc.arc (use supunarc.com to un-arc it). Each is
compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is
uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER
it into Atari BASIC). The file yau.arc contains yau.com, a machine-language
UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible

with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS

800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 1i BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

End of FAQ list.

>Has anyone had this problem? I suspect my modem settings need to be changed.
>Thanks.
You need to set your modem to send verbose status codes, i.e. CONNECT 2400 instead of numeric responses. I think the command is either ATV1 or ATX1 (never can find that command list when you need it!)
Also, I have a modem that sometimes sends a false BUSY response, but when that happens, you dial gain and it works fine.

>--
>Joe Sabatino-->ab588@yfn.ysu.edu

The Bob Wooley rom is the original XF551 upgrade, which just changes a few bytes in the drive's OS so that it can handle 80 tracks. It does double speed like the original XF551. Bob Puff's upgrades are advertised as being even better, with ultra-speed i/o (like a US Doubler), and without the XF551's notorious density-switching problem. And there is the dual drive upgrade that lets you use a 5.25 and a 3.5 floppy drive at the same time, each with its own drive number.

(No, I don't work for CSS, and I don't even own one of these upgrades--yet.)

Bill Marcum bmarcum@world.std.com

4254. Who knows the Atari 200?

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-12 12:42:24 UTC
From: Marek Tomczyk <UJ1G@DKAUNI2.BITNET>
Message-ID: <1992Nov12.124224.13453@rz.uni-karlsruhe.de>
Source record: 109052

Hi everybody,

while browsing through a book about 6502 assembler programming
I came across a statement that mentionned an Atari 200 computer.
It says something like : 'The 6502 processor is used in various
computer systems like the Apple I, II, III; Atari 200, 400, 800;
^^^
Commodore PET, ...'

I've never heared anything about an Atari 200 before. Is it just
ignorance of the book author, or did a 200 model really exist?
Any specs?

Marek Tomczyk

uj1g@dkauni2.bitnet

4255. Re: xf35 vs. bob puffs conversion???

|> support high speed i/o??

I don't know what the bob wooley (sic) rom is, but the CSS XF551 conversion does not come with a ROM to go in your 'XL. It comes with parts to be soldered into your '551. This (the Bob Puff) conversion to 720k drives supports high speed I/O. Note that you need either Sparta DOS or the US+ OS to take advantage of high speed I/O. Your old disks (if you use 5.25) will read only slightly faster. If you create new disks with the Ultra-Speed skew, they will read appreciably faster.

4256. Digi-Studio is ready, and available in the US!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-12 16:56:41 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Nov12.165641.7413@aber.ac.uk>
Source record: 109053

Here we go folks. Digi-Studio is at last finished! Tagged on to this message is the info "sheet" for the brand new Digi-Studio package. To make it easier on you all, Digi-Studio is available in US direct from my US distributor. Please email Lance (address at end) to get the price for shipping. Copies of Digi-Studio are being shipped to the US next week. However, you may send your advance order now to be one of the first to get Digi-Studio in the US! The new version contains an option to re-time playback for NTSC machines. Don't delay - order your copy today!!

Digi-Studio Information

Digi-Studio is a set of programs for the 8-bit Atari (XL/XE) for creating music using "real" sounds, which have been digitized. The Digi-Studio package contains everything you will need to create and play music using digitized sounds. Here's a list of the programs included:

* Keyboard Player. Allows you to play music live by using the computer's keyboard like a piano keyboard. The sounds produced are, of course, digitized. This program has fully responsive keys, so that sounds only play for as long as you hold the key down.

* Tune Player. This program plays Digi-Studio tune files using digitized sounds.

* Sample Editor. This program allows you to edit sound samples by using a joystick. It also has "cut and paste" facilities, so you can also create your own samples.

* Tune Compiler. This program allows you to play Digi-Studio tune files in your own Basic or Turbo-Basic programs.

* LIDS Compiler. This program allows you to create your own Digi-Studio tune files by use of a language called LIDS.

Also included are 55 sound samples, and 44 ready-to-play Digi-Studio tune files.

The Digi-Studio system comes on 2 DS/SD disks. Disk one contains the main programs and a starter pack of sounds and tunes. Disk two contains more samples and sounds for use with Digi-Studio.

The Digi-Studio system is also supplied with a 44 page manual in A4 size. This manual has sections describing all the programs listed, but also has a lengthy section on how to read music. An appendix has also been added containing music along with the corresponding LIDS programs.

The Digi-Studio system (with manual and 2 disks) costs just 12pounds+1pound
P&P. In the US it will cost $29.95+shipping (price to be arranged).

4257. Re: Writing Atari disks on IBM PC's

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-13 09:42:16 UTC
From: mreichl@cosy.sbg.ac.at
Message-ID: <BxnEyG.6Bp@cosy.sbg.ac.at>
Source record: 109054

About one year ago i wrote a program (for PCs) to read, write AND FORMAT disks for the XL (only double density - like the other existing programs to access XL-Disks).
There is only one problem: if you are using an AT with a HD (1.2MB) drive - remember: HD disks rotate with 360 RPM instead of the usual 300 RPM - it is unsave writing to disks formatted on the XL. Formatting disks on the PC causes no problems (reading & writing with the XL is ok).

The program is menu-driven but cannot handle MYDOS-SubDirs.
I'm currently working on a new version including 3.5" HD-Disks and MYDOS SubDirs.

If anyone is interested, please mail. (Sourcecode is in TopSpeed Modula 2, Version 1.17)

so long,
Hias

4258. atari 800 keyboards or systems wanted

I have a large stack of ANTIC magazines (1985-88) that I
would like to trade for some other stuff for the Atari 8-bit.
I don't want TOO much, but I expect shipping on the magazines
(from past experience) to be around $12-$15. So, kep that sum
in mind when you make a trade offer...
maybe a couple of cartridges or something?
(Am interested in Coleco/Intellivision/Atari 7800/Odyssey 2
stuff too)
send me e-mail and I will list the magazine issue numbers
I think there is about 30 magazines
.

4260. Re: GTIA/CTIA (was Re: old atari carts, (400/800) Now answer wi

Message-ID: <69447@cup.portal.com>
Source record: 108956
Cross-posted to: rec.games.video,comp.sys.atari.8bit

One other thing the GTIA did was move the PM's so they'd overlap a pixel
in any of the 160X(anything) modes including character graphics with that
rez.
Mindless ramblings on the cartidge port. Since I occasionally burn carts,
I was always upset Atari left out the RIGHT slot, until I started looking
at the schematics. Turns out the X<?> series includes all the functionallity
of a two slot machine in the single slot. I'm not sure about the Monkey
Wrench, but if you get one of the Atari game carts (Galaga for instance)
tht was made when they were still using IC sockets, you can plug ROMs into
both sides of the cart & they will act just like you had the equivalent
carts plugged into the right & left slots of the 400/800. At one time I
started looking at adding a Monkey Wrench type cart to the X series & it
was about as easy as cutting a single trace on the cart board & plugging
the ROM in the other side of the PC board. I never really fooled around to
much with it at the time, but you can come up with built in basic & a cart
ROM in memory area $8000 to $9FFF. I guess at the time I was worried it
would make it to easy to pirate carts, so I kept my mouth shut. Still a
lot of people with an XL, Exacto Knife, & interest in 8-bits at the time.
Seems irrelevent now.
Anyway, I decided there wouldn't be much interest in a real application.
Most people that program in basic wouldn't be interested in something
that would reduce the amount of ram by 8k or limiting their progams
to 8K to fit in a cart.
**********BUT**********
If someone was really interested in doing something like putting every
USR(????) they've ever seen into a cart for use from basic, it could be
done.

More ramblings: No doubt there was something you could actually hold in your hand. I was lucky enough to get to combined Atari Wharehouse & Federated liquidation sale. You wouldn't have believed the stuff they had there. There was a computer in a bright blue plastic case named "Patty", four 1450 XLs with poorly fitting cases, 1400 XLs. There's even a color organ at Weird Stuff right now with the Atari brand name on it. At one time, Atari was about 7000 people & $2 billion/year in sales. You can't imagine the resulting prototypes/projects that come out of a company that size. I think it's down to about 200 employees now which explains the lack of new products we see. Really though, for a company their current size, they aren't doing that bad.

4263. Stuff for sale.

4269. What about Appletalk?

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-16 16:08:49 UTC
From: Ryan Collins <RC1DSANU@MIAMIU.BITNET>
Message-ID: <92321.110850RC1DSANU@MIAMIU.BITNET>
Source record: 108967

With my recent purchase of a Mac (PowerBook 100), and my own lack of drives for my 8-bits, I was wondering about the feasibility of adding a localtalk port to the 8bits. Before anyone says this is impossible, keep this in mind. A localtalk is only a serial port running at 230 Kbaud which should be easy enough to construct through the parallel port. Also, with a networking card, Apple IIs can be on an appletalk network, able to access file servers and printers.

So the first part of the project would be to find out all you can on Appletalk. This could be the biggest stumbling block since I've heard that the protool is a bitch. After this is found out, it should be fairly easy to construct the serial port, and include the ROM code to boot off of a server.

I have nowhere near the expertise to even begin a project of this magnitude, but I was figuring those of you out there might. (I feel like Steve Jobs!!)

Any comments? Suggestions?

Hmm. There may be some substance to this Atari 200 'Patty'. Years ago, in my infancy with Atari computers, I too heard of an Atari computer named "Patty". From what I can remember, though - it was some sort of test computer - never marketed or made available for sale. If memory serves, it had something to do with the PDP-11 or something. Who knows, but I distincly remember hearing/reading something about it - so I can substantiate at least the claim.

Source record: 108974

It could be possible that there was an Atari 200 since I
once saw a 250ST at a local shop. It had the usual grey case
but no function keys. Instead, there was a set of pastel coloured
buttons. I think they controlled disk functions (Load, Save, etc...)
I had never known about this computer until I saw it. Could be
ignorance on my part though!

Sure sounds like an XE game System!

4282. ### Amiga, Atari, Mac, "general" computer stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-18 05:08:48 UTC
From: clf3678@ultb.isc.rit.edu
Message-ID: <1992Nov18.050848.26759@ultb.isc.rit.edu>
Source record: 108979
Cross-posted to: misc.forsale.computers,comp.sys.atari.8bit,misc.forsale.computers.mac

(This is a repost!)

All sorts of electronic goodies for sale, including stuff for the Atari ST, Amiga, Macintosh, and "general" computer stuff. I want to get rid of this stuff NOW, so make an offer if you feel these quite reasonable prices are too high!

If interested in anything here, please send me E-Mail.
Everything is sold as-is, with no warranties expressed or implied. The condition of the items, to the best of my knowledge, have been included with the descriptions (where needed).

Prices listed do NOT include shipping! Prefer you send payment first, but I *WILL* send COD if you order more than $50 worth of stuff.

****
4-position Centronics switch box: $10
- Lets you share a 36-pin Centronics device (printer) among up to 4 computers by turning the 4 position knob. Worked last time I used it.

Giltronix auto-switching RS-232 box: $25
- This is a really neat unit. It allows you to share an RS-232 device (like a modem) between up to *7* computers. The box *automatically* switches between the computers so you don't have to keep turning a knob to do it! Lets you set up how long a duration of inactivity before the box breaks a connection. Has a front power switch to turn it on and off, and a 7-segment display to show which of the ports has the box's attention. Includes user's manual. This is in mint condition. I got it new, and only used it for a few weeks.

AT-style computer case: $10
- This was a full-size AT style case with 3 external/2 internal drive bays. The case was modified, removing the bottom external bay and by cutting a slot in the case so you can see one of the internal bays. Other than that, it's in pretty decent shape. You can still stick a power supply and AT motherboard in it and use it as a computer, or stick a bunch of hard drive in it and use it on a BBS (like I did). Does NOT have a power supply.

Misc. cables:
- 10 foot 36-pin Centronics (male) to 36-pin Centronics (male): $5
- 10 foot DB-25 (male) to DB-25 (male), brand new: $5
- 25 foot DB-25 (male) to DB-25 (male): $7

- Amiga -> Atari SC1224 RGB monitor cable: $7

Emerson AM/FM clock radio: $5
- Just what it says above. AM/FM clock radio with alarm. Worked last time I used it.

Percom disk drive controller board with power supply: $15
- For use with the Atari 8-bit computer. Originally in a Percom disk drive, this controller will let you hook up 2 "standard" floppy drive mechs to the 8-bit. Includes hardwired power supply.

Scotch ejecting tape holders: $0.50 each
- These are neat cassette tape holders. They are single units, which you can interlock with each other to make a large tape rack. A tray holds each tape, and a button pops it out of the holder.

"The Generals" electronic game: $5
- Basically an updated, electronic version of Stratego. A little battery-operated computer senses the codes on the bottom of the game pieces to determine the winner of each "battle". The ranks of each piece are the same as today's army ranks instead of the 18th century ranks used in Stratego. Other than that, the game is identical. All pieces and box included.

Dust cover for Atari SC1224 monitor: $2
Dust cover for Atari 520ST (not STFM) computer: $2

QuickShot I joystick: $5
- BRAND NEW pistol-grip joystick for Atari and Amiga computers. Has buttons on base and at top of pistol grip.

SimCity Supreme (Macintosh): $30
- Bought this program last week. Like it, but need the money. What more can you say about this very popular program? Includes registration card.

Patton Strikes Back (Macintosh): $10
- Fight the Battle of the Bulge as commander of either the American or German side. Multiple levels of difficulty. Very nice game!

4283. 640 x 192 x mono mode...

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-18 05:31:23 UTC
From: phbill@cyberden.uucp
Message-ID: <1i7euB2w165w@cyberden.uucp>
Source record: 108989

does anyone out here have a lot of knowledge in interrupts, DLI's, etc?
I've already asked Jeff Potter about it (I just sent the mesg, so of
course I haven't gotten a reply yet! :)) and about sending me the
sourcecode to interlaced APAC mode.. what I'm getting at is a 640 x 192
mode using 16k (14-15 actually) of 320 x 192 (graphics 8) screen and
flipping between the two... a breif example of how it works is this:

say you had an 8x8 character bitmap:

```
12345678
1 ******
2********
3********
4*** ***
5** **
6********
7 ******
8
```

you would first display this (this is NOT using the multi-flipping that
Ilc'd APAC & colrview use):

```
1234
1 ***
2****
3****
4** *
5* *
6****
7 ***
8
```

then you'd display this:

```
1234
1***
2****
3****
4* **
5* *
6****
7***
8
```

together you'd get something like this:
(assume the background is black and the foreground is light...
the "*" would be lightest, the "+" would be medium, and the " " would be
darkest)

```
1234
1+**+
2****
3****
4*++*
5* *
6****
7+**+
8
```

get it? anyone interested in such a mode? it would even work with normal graphics 0 screens, not allowing for 80 column text (with 8x8, like this does) but for 40 column text, with a rounder feel (16x8x2, sort of a 8x8x4!)

and finally, it could even bump up the 4 color 160 x 192 (x96) modes to 4 color 320 x 192 (x96)...

and of course, nobody forget my original idea for a low-memory 80 column text screen!!... flipping two screens, one with the left (even column #'d) characters, the other with the right (odd column #'d)... it'd use either a "left" & "right" character set pair, or with the scroll registers and a "left" character set...

then if you wanted to display "Hi there!", you'd first show:
"H hr!" and then
"itee " ...

c'mon... I don't know how to make this stuff! anybody up to it!?

The following are for sale - make offers please- all offers welcome-
lease feel free to offer any amount that you think this stuff is worth!

1. Intellivision cartridges- MOST of them have ORIGINAL BOXES-

Lock 'N' Chase
Space Hawk
Astrosmash
Burger Time
Donkey Kong
Pitfall!
Space Armada
Triple Action
Star Strike
Las Vegas Poker & Blackjack

2. Magnavox Odyssey2 system-
Magnavox Odyssey2 base machine with joysticks, power supply, and TV cable,
working and ready to use, plus the following games for it:

Alien Invaders-Plus!
Out of This World! / Helicopter Rescue!
Pick Axe Pete!
Football!
Bowling! / Baseball!
K.C.'s Krazy Chase
Blockout! / Breakdown!

I am looking for best offer. I will GLADLY consider any and all offers!
Every response I get at this end will be acknowledged Please e-mail to
COHEN@GOMEZ.PHYS.VIRGINIA.EDU , or call (804) 293-8973 if you do not have e-mail
access.
Thanks.
==========
P.S. I also have Atari 2600 hardware, Sears Video Arcade II machine,
and cartridges for them as well as
a TI-99/4A with 10-15 different game cartridges and more productivity cartridges
for sale separately. Please let me know if interested.

I am looking for a program called Turbobase or Turbobase 80 depending on which version you may have. It was produced by Micromiser Software. The last address I have for them is in Sorrento, Florida. Does anyone have this collection of programs....It was an inegrated business package that included a relational database and a spreadsheet, word processor etc. If you have a copy I would like to make an offer on it. Also, does anyone know if Micromiser is still around? They made a similar program called Ultrabase ST and if they were making programs for the ST, maybe they are still around.

I have an Atari 800XL with a 256k RAMbo upgrade. A friend of mine added another 256k for 512k total, but I don't know if it works!
The Sparta RAM disk works fine with the RAMbo upgrade up to 256k, but can't recognize any more memory. Is there a program I can get that will use this RAM (I mainly want to know if it works!!!).

I'm also interested in the value of these two 8-bit systems:
1. Atari 800XL, 512k RAM? (the one above), Omniview OS (with switch to standard OS), 1050 with US Doubler, Commodore 1702 color monitor, Atari 1027 printer
2. Atari 800, 850 drive, 1702 monitor

They're not for sale (right now) but it's been a while since I've used them and I'm curious as to their value now...

Also, where can I get a really cheap 850? (around $20.. maybe a ridiculous offer, but I can at least ask, right?)

The 260ST was one of first ST-line computers introduced in Germany. It wasn't just vaporware. I've found many of them in different department stores around me. Lateron you could notice some adds in computer magazines offering memory upgrades and built in ROMs for the 260ST. The original 260ST worked with a disk version of TOS.

Just my $.2

Hey...

I'm brand new to this newsgroup (just started reading it yesterday),
but I literally grew up with my die-hard 1200XL ... The last time I
really used it was to program some fractals during high-school, but
I have refused to get rid of it, and reading this newsgroup has given
me incredible nostalgia.

So now I'm hearing about Atari Classics and it sounds like something
I really want to read but I have no clue what it is or how to go about
getting it. Can somebody help me?????

Issue 9 of the News-Disk is now at the archive, currently in the New directory and is called issue9.arc. It will eventually get moved into the Djg directory.

I'm surprised that people in Toronto haven't received theirs yet. Unicorn
mails all mags outside of the US via first class mail (both AC and AIM).
I know mine came first class and I received it about two weeks ago (I live
somewhat north of Toronto). In any case, with the recent flurry of posts from
people just now receiving their copies, it seems everyone should have them in
the next week or so.

What's the best small text editor. I have "T:Edit," but I personally think it stinks. I'd like to see a totally shrunk down of TextPro. (I'm looking for something with 40 columns, unlike T:Edit, and that supports all 255 ATASCII characters)

I'd also KILL for the source to it (or any other word processor-like text editor)!

thanx

I have noticed that the AtariDos driver on the X cart seems not to
like reading some atari disks. Like...3.5 inch mydos disks and
most importantly mydos partitions on the harddrive. however....
sparta 3.2d reads them fine where x just says its an unrecognized type.
Any reasons?

Also...someone was going to post a list of the differences between
X 2.19 and x 2.20
Hello?

Ferris?

The only difference between version 2.19 & 2.20 of SDX is ATARIDOS.SYS (according to ICD shortly after I bought version 2.19). There were some problems reading AtariDOS disk formats with version 2.19.

There is no need to upgrade the SDX ROM to 2.20 though. Get your hands on a disk copy of ATARIDOS.SYS version 2.20 (it used to be available through ICD's BBS), then change your CONFIG.SYS to DEVICE = d:>path>ATARIDOS.SYS where d:>path> is the drive and directory where the file is located. After booting you will be running version 2.20 of SDX.

About 2 years ago, Ronnie Ritche (author of TextPro +) announced a final version of TextPro and offered to provide a copy of the source code to any registered user who paid some extra money for it. ($12, plus upgrade charges I think) I sent Mr. Ritche the money, but never received either the final upgrade or source code. A follow-up note sent a few months later when the intended shipping date slipped past went unanswered.

I sold all my Atari 8bit stuff a year ago out of necessity, so I counted the money as lost. Anyone know if Mr. Ritche ever did release the TextPro source code to anyone?

BTW, the original version of TextPro had its roots in COMPUTE!'s SpeedScript. The source code for this was published (although as machine language BASIC data statements).

Man, that IS cool!!! WOW! I just got my copy today! I was pretty impressed! No flashy color or anything like good old Antic & Analog (neither of which I ever subscribed to anyways... I just got back issues from a friend), but still very good. (I especially liked some of the writing style which I guess could've been done by Ben?.. like #13 on the Swap 'N' Shop rules: "..We'll make every effort to handle your ad responsibly, but we're human and muff it every now and then.." :)

Also, I did think Alan Sharkis' column (essay) "Provincialism as a Factor in the Survival of User Communities: Necessary But Not Sufficient" was a helluvan eye-opener (I'm not a 100% Atari devoted "get that IBM out of my sight" type of person, but I do know a lot of IBMer's who're like that (except with Macs & the such).)

good job guys!!!

Hey guys, you are talking about Sparta 4.19 and 4.20, not 2.19
and 2.20. And there are more differences than just the Ataridos
module..here is what the insert to the manual says the diff. is:

"These changes were made for release 4.2 of SpartaDOS X:
Compensation added for bug in Atari Basic which caused no EOF when
stack pointer <$80. Extra EOF removed when using CIO put-record
with ICBL set to 255 and record length less than 255 when not using
X.COM or CAR.COM.
"X.COM changed to work properly with AtariWrite[r] Plus and other
programs that execute reset code as part of initialization (this
modified X.COM is available as XX.COM from our BBS (1-815-968-2229)
and as XX.ARC on GEnie and CompuServe).
DUMP now resets left margin to previous value on exit.
FORMAT resets and restores CHBASE to "look right" with programs
(such as AtariWriter Plus) tat use redefined character sets.
"Error when attemting to execute 0 length files corrected.
High speed supported for formatting XF551 drives modified with
3-1/2" 720K drives using Bob Wooley's modified ROM."

4334. 800xl I/O sounds

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-23 16:50:06 UTC
From: kspeicht@kilcom1.ucis.dal.ca
Message-ID: <kspeicht.70.722537406@kilcom1.ucis.dal.ca>
Source record: 108874

Any help with the following 800XL questions would be appreciated.

Does anyone know the poke commands that disable the keyclick sound
as well as the disk i/o sound on the 800xl.

Also, what devices are availible for the parallel expansion slot.

How does one transfer binary tapes onto floppy. I have an 800
with an 810 disk drive. I just bought this 800XL with a 1040 tape
drive. It came with an original copy of Zepplin on tape, as well as
Soloflight and several others. It would be nice to be able to use them
from disk instead. Some games have neat music when they load from tape
though. This must be a 4 head tape deck.

Thanks in advance.

Actually, I have the source code for TEDIT & I though you did too???
It was on an ANALOG disk anyway. Like jim said, the source code for
SpeedScript was published, but if you want the actual source code vs
data statements, your have to buy the SpeedScript book (about $12 at
B&C if I remember correctly). I have the book, but never sent away for the
program disk or typed in the source code.

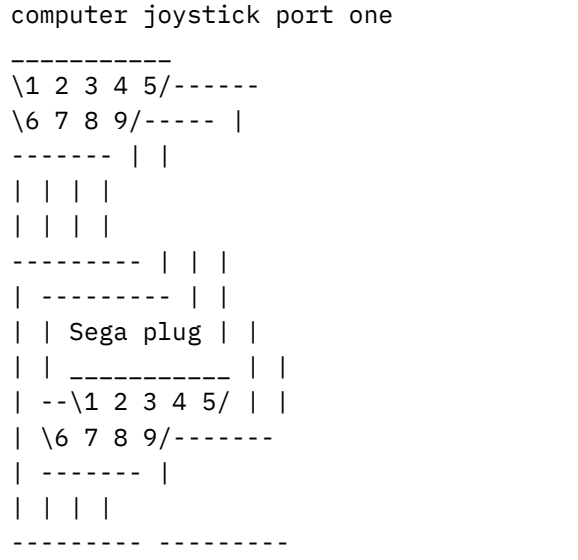
You just can't plug a SEGA lightgun into an Atari...you have to change the wires around...since the question was asked I can put the articles us which appeared in Zmag and the Pugeot Sound news letter written by Dennis Grifin. (Permission Granted to use it again.) Here it is:

Sega/Atari Light Gun
by Dennis Griffin

It seems that in "Atari's Great Marketing Plan" the 8-bit users are to be forgotten again. Atari released a wonderful game, Barnyard Blaster, complete with great graphics and special effects. I can even buy it locally. What's the problem? To play the game you must have a light gun. No problem for the owners for the new XE Game Machine (a redesigned 65XE), for the light gun comes with the unit. However, this light gun is not sold apart from Game Machine.

Add to this a house full of kids watching their friends use the Sega and Nintendo light guns. That gave me an idea. Hook up one of the other guns. The Sega Has the same kind of plug so I tried that one.

To make it work you must change the pin out.



AS YOU LOOK AT THE COMPUTER AND SEGA PLUG

Note:The connection from the computers #9 pin is made to the #8 pin of the Sega plug.

I also adapted a light pen program from Analog.

```
10 REM TARGET
20 REM BY DENNIS GRIFFIN
30 REM XADJ & YADJ IN LINE
40 REM 100 FOR SOFTWARE
50 REM SIGHT ADJUSTMENTS
100 XADJ=10:YADJ=12
110 GRAPHICS 7:POKE 712,14:POKE 708,0:SHOTS=0:POKE 752,1
115 COLOR 3:PLOT 0,80:DRAWTO 0,0:DRAWTO 159,0:DRAWTO 159,80
120 COLOR 2:PLOT 80,20:DRAWTO 80,60:PLOT 60,40:DRAWTO 100,40:COLOR 1
125 PRINT " TARGET BY DENNIS GRIFFIN"
130 IF PEEK(54016)<>255 THEN 130
140 SHOTS=SHOTS+1
150 IF PEEK(54016)=255 THEN 150
160 X=PEEK(564)-XADJ:Y=PEEK(565)-YADJ
170 IF X<25 THEN X=X+228
180 X=X-80:Y=Y-18
190 IF X<0 THEN X=0

I think there is a utility in the atari.archive that enables you
to transfer programs on tape to disk called TAPEDISK.
I think these are the POKEs you want:
POKE 65,0 <-SIO sound off; POKE 65,1<-SIO soud on
POKE 731,1<-speaker off (XL/XE only) POKE 731,0<-normal
The only devices I am aware of that connect to the paralell bus
is the MIO and the Black Box.

To turn off I/O noise, type "POKE 65,0" in BASIC, or make a small binary program that has the following bytes:

255
255
65
0
65
0
0

and load it from DOS. To turn off the keyclikc, type "POKE 731,1" in BASIC (yes, ",1", not ",0".. ",0" turns it back on).
As for making it a binary file, just make a file w/ these bytes:

255
255
219
2
219
2
1

Other interesting locations include:

752 - cursor inhibit (cursor on/off)
82 & 83 - left & right margins (0-39 for each.. 0=leftmost, 2=default left, 39=rightmost (default right))
703 - text window. You can either trick a fullscreen screen into thinking it has a text window (you won't see what's being written, of course, but anything normally PRINTed that would usually switch the screen back to Gr.0 text mode won't do it any more.) You can even trick the Graphics 0 text mode into thinking IT has a text window! The bottom 4 lines of the screen will be the text window, and even the normal screen's cursor position won't be changed! (because text windows have their own set of cursor position coordinates.)
730 - key repeat speed. 0=no repeat, 1=VERY fast, 6=normal.
555 - changing this before each key access (like a "GET" from the "K:eyboard" device) to a certain number (who's speed represents the same speeds as 730 has) changes the initial key repeat start delay. (ie-

Well, to tell you the honest truth, I too am one of your fans. I don't
have AR, but I borrowed it once from a friend, and MAN was I impressed!
Sorry I didn't recognize you right off, but it'd been such a LONG LONG
time since I last played it (the City was the one he had). Now at my
high school they have Castle Wolfenstein 3D and seeing that games stone
walls brought back some fond memories (as I already noted, no names ;))

Great to have you back..

It's me (at least the last time I looked into the mirror :)). The rumors
are true I bought an amiga (no longer own it though, GE has it.), and I
work on mainframes (actually midsize computers and workstations in a
highly distributed environment), I also am a Principle Member of the
ANSI C++ committee, and my main work on the above mention workstations has
been to create and design the B-2 stealth bomber mission control rooms(mainly
the software :). I have truely been overwhelmed that people remember me
from so many years ago. I must say that the biggest reward I received in
creating those products was the joy it brought people. It makes the effort
I (and don't forget Gary Gilbertson wrote the music:) put into them.
Phil
P.S.
I really am amazed with the response I have received in one day. I was
expecting more of a "sure upload the source somewhere, by the way what
is it to? " type response. Instead I recieved many thanxs8), and that
warms my heart. Thanks :)

There are *plenty* of us 8-bit enthusiasts out here Philip.
And there would be a lot more of us if there were still people
producing the kind of stuff you did.
I too loved the Tail of Beta Lyrae. When my disk of that game went
bonkers, I almost went bonkers myself. I even tried to find Paradise
Programming in Hawaii and track you down so that I could get some help
in finding a way to get my copy repaired. Fortunately, I managed to find
someone selling all their 8-bit software, and Beta Lyrae was included.

Do you still do anything for the 8-bits or have you forsaken them to
be just a part of your life story? Do it again! :)

Tim Hester

4352. Atari as function generator

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-24 08:40:06 UTC
From: spam@iastate.edu
Message-ID: <By7pEv.nq@news.iastate.edu>
Source record: 108896

Well, I have a new temporary use for my atari and I wonder how many
others have used theirs in similar ways...

I'm taking an "introduction to digital electronics" course this
semester, and it it entirly theoretical; there is no lab where we get
to actually build any of the circuits we design. So, in an effort to
get a more "real world" grip on the subject, I wired up a radio shack
"Experimenter's Breadboard" to one of the joystick ports, and poked
the datalines to be output. So now I can generate any 4 bit binary string
on the atari, and let it generate various test sample inputs for the
circuits I'm building.

So I breadboarded a 2 to 4 demultiplexor out of ands & inverters,
and let the atari poke cycles of 0-3 on the output line, and
"display" the result with LEDs, so I have 4 LEDs blinken-flashen
in a row...looks rather nice.

next step--have it drive moters & build a little robot or something...

-mike

Thanks for all the info everyone. I notice that the power supply
for the 800xl gets much hotter than my old 800 power supply. Is it a good
idea to leave these plugged in all the time, or should you just plug them in
as needed?

You mentioned the atari.archive. How does one get these
files. I know how to FTP and all, but I only have an 810 disk drive and
Atari DOS 2.5. Are they uuecoded? If so how do I get them. I have a Unix
NCD terminal and a PC at work. This will allow me to easily get them but
then how do you put them onto the atari. If I have to upgrade my disk
drive or DOS, which one should I get? I'd like to also be able to make
duplicates of some of my more important software (M.U.L.E. and Archon).
Should I get a modified 1050 or are there better drives to get?

Thanks in advance.

There's a few 8-bitters still active. We seem to be a mix of the young & old (at least old by computer literate standards). I certainly enjoy the mix that's left. We seem to be a throw back to the early days of computers: Approach your computer with soldering iron & open mind vs trepidations & bloated application software. This is a nice friendly place to be, can't remember there ever being a genuine flame war in the last year, but then there's not that much traffic <g>. Most of us seem to have 'other' computers but still have the 8-bits in common.
Bill Wilkinson is still around, but sold off all his 8-bit stuff. He drops into BAAUG every once and awhile & has a net account at Kludge.com. Bob Puff seems to still be making a living off 8-bits @ CSS. Bob Wooley, in addition to numerous hardware mods, has a fabled attic where he's trying to archive every 8-bit program ever made! Of course Jeff & Ben are getting a mag going & occasionally notables such as yourself drop by. I know you moved on before "The Dungeon" was finished, but you still see questions about it or "The City" posted. They seem to get more band width then any other games such as the Ultima series. Which reminds me! Can you really complete either "The City" or "The Dungeon"? Everyone says you hinted they could be completed, but no one has ever done it. Well... if you haven't targeted someone to take the disks yet, I'd certainly like to have them. Mostly done with Trak drives right? Just let me know how much you'd like for them & give me an address to send the $$$.

4357. 8bit Emulators (again)

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-24 19:12:02 UTC
From: kimes@cbnewsc.cb.att.com
Message-ID: <1992Nov24.191202.13421@cbnewsc.cb.att.com>
Source record: 108901

With all the discussions lately about using an MS-DOS machine as a platform for Atari 8bit emulation, I thought you would find this bit of information fascinating. There is an article in the latest Znet Online magazine (the one that covers COMDEX) about Derek Mihocka's GEMulator. He is releasing V 2.0 of his software that goes with the hardware board. One of the interesting points he makes is:

"We are about to prove some more self proclaimed "experts" wrong by adding Macintosh and Atari 8-bit support to the same Gemulator boards that you already use! For details, make sure you're on our mailing list for the newsletter. If you've never received the "BraSoft News" before or have moved recently, then please send us your updated mailing address information and we'll put you on our mailing list!"

Since I don't own the GEMulator (ST emulator), I am not on his mailing list. Is anyone out there? This is still a future product and no other information is given. For instance, what a setup would cost. I think the GEMulator with the TOS ROMS is over $300. Maybe you wouldn't have to buy the TOS ROMs if all you wanted is 8bit emulation. Then there is the matter of software. Derek wants $60 for the ST upgrade package. On the positive side, if Derek says it can be done, I believe him. He is the one that wrote the 8bit emulator for the ST and had a software version done for the MS-DOS machines but wouldn't release it because he couldn't get Atari to agree to allow him to put the 8bit source code in his emulator. Anyway, if more information comes out somewhere that I read, I'll post it here. If you want to write to Derek and try to get on his mailing list, here is his address:

For more information on the Gemualtor, contact: Branch Always Software, 14150 N.E. 20th Street, Suite 302, Bellevue, WA 98007 U.S.A.

Keep those little 6502C's humming.....

Hmm (either I didn't notice my second post when I read the news or I
a) sent to a individual instead of the newsgroup b)sent it to atari8bit
instead of atari.8bit[what happens then(I am new to internet)]. In
either case here is a brief summary of my second post (If it did arrive
just ignore this message :).

I just wanted to say thanxs to all of you who enjoyed the games, you made
it worth while. It made my day when I posted about the old source code that
many of you sent me email about how you loved the games. Thank you.

In reference to the rumor mill (ie. what am I doing nowadays), I work with
Silicon Graphics Workstations, Encores, Hps, Decs, etc and am the main
designer of the mission control room display software for the B2 Stealth
Bomber. I also spend some of my time as a principle member of X3J16, the
ANSI committee on Programming Language C++.

Someday I need to take time off work and get a degree from a good university
(I did take courses in reverse order from Chapman[but it was no challenge])
and get a good wife to share life with. Anyways, you now know more about
my current life than anyone wants to know:). So again I do want to thank those
who enjoyed those games, you really made it worthwhile:).
Phil
P.S.
Now all I have to do is get those disks out (fire up one of my old ataris
[1200xl, 130xl 800 etc] and see if I can find the old serial inteferace
peripheral.
P.S.S.
What do people use for modem software on the old ataris? (ie. I could
always just write one, but it would be faster to use something that
preexists).

>The local newsstand had 5 copies!!!

Cripes... Newsstands in wherever-Joe-is (Sonoma?) have it, and I who sent in my postcard for my very own personal copy, DON'T yet. Haven't heard of anyone locally getting it yet, either...

I'm still on pins and needles... Ben, Jeff, what's the scoop behind this? What's the mailing schedule and are you having any problems?

(Now that I've bitched publically, watch it be in my mailbox when I get home tonight. :-))

>This place also gets RUN, imports from UK, FR, and Germany and tons
>of other small stuff.

Sounds wonderful! It must be nice to live in a "major" city. I always thought Rochester was one such, until I found out we have hardly anything "brand new." We only get stuff after the rest of the country has chewed it up and found it acceptable. Heck, my sister has better bookstores and movie theatres in Missoula, Montana, than we have here...

Oh well.

Well, I sent mail but since everyone else is posting, I have to too!

THE Philip Price! Of AMP co-fame (w/Gary Gilbertson), no less! Wow, talk about the presence of Greatness! (Talk about fawning.)

I'd be very interested in seeing the source code (if that's what's being offered/included), documentation, or basically ANYTHING that would illuminate the innards and operation of AMP. For one thing, I'd like to extract the actual score of "Passionately." I LOVE that song/program. :-) Have tried without success to reverse-engineer it all (code, data format, self-executing-program-and-data-file format, etc.), without success. Now I'm kinda glad I didn't succeed because I'd rather receive the info direct from YOU, without having already "ripped it off" so to speak.

Wow! Sounds too cerebral for me. :^) But I think it's really cool that
a famous ATARI programmer of old is on the Internet and working with UNIX -
both of which I consider to be the epitome of computing.

>Someday I need to take time off work and get a degree from a good university

> Phil

I didn't remember your name automatically - too long since I last booted
up Beta Lyra. But that was one of my very favorite games on the 8-bit!
Never could quite finish it - I always died before the end. But I was
getting closer and closer, last few times I played it. Great game!

>P.S.
>Now all I have to do is get those disks out (fire up one of my old ataris

I used to use BobTerm for BBS's - it's still the best I've found, for
applications where 40 columns isn't a handicap. However, all the
telecomputing I do nowadays is on UNIX systems, so I have to use OmniCom
for its 80-column capability.

Welcome to c.s.atari.8bit, and I hope you'll stay around!

4368. atariwriter+ and Alt Reality...

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-25 00:55:02 UTC
From: brownan@vax.sonoma.edu
Message-ID: <1992Nov24.165502.1@vax.sonoma.edu>
Source record: 108807

OK folks, I have a question.

I copied my original atariwriter+ to spartados 3.2d format.
It works fine with the exception of two things.
They are:

a) there are a bunch of control characters randomly placed
throughout a file once I retrieve it from disk. It
really doesn't affect things except that unless I remove
them manually, they print out like a reverse '. Is there
any way to eliminate this problem?

b) when I get to the proofreader, and try to go back, the
program crashes. This is also annoying.

does anyone have this problem?

Another question, Is there any way to get an rtime 8? The way
I have my startup file for sparta dos, I have to manually enter
the time, and it is very annoying, especially if you tend to
crash the machine alot with stupid programming projects that
never get finished(like what I do)

Finally, Is there anyway to get the atariWriter+ to recognize
and use more than 128k? I have a 256k 800xl and It would be
nice to be able to use this xtra memory.

By the way, who is this guy who wrote the alternate reality series?
We should try to start a grass roots movement to get him to at
least try to help out to try to finish the series.
My brother and I were hooked on both the city and dungeon.
It would be cool to be able to finish the whole thing,
wouldn't it?

Thanx alot
Anthony Brown

4369. Which disk copy program?

Newsgroup: comp.sys.atari.8bit

Message-ID: <1992Nov25.072559.16287@zip.eecs.umich.edu>
Source record: 108811

Wow! I have been perusing the new Atari Classics magazine. I am impressed.

Anyway, I have determined that I need a disk-copy type of program for my 800 and XF551 drive. Since the only problem with the drive itself seems to be with some protected software, I would like recommendations on which programs are good for this kind of thing.

I have an old (worthless) copy of "Lockpick" and need something better. I have used Copy II+ on the Apple II and IBM with success. I see that American Techna-Vision is selling Chipmunk for about $35, and a few others that look like copier software: Scanalyzer, and Advanced Protection Techniques.

Which program can you recommend, that will actuallyhelp REMOVE copy protection?

AS> BOY I'd sure lake to see that patch to put on my Atariwriter plus!!

I sold ALL my Atari 8-bit stuff just over a year ago, so I no longer have the docs on the patch. However, a former colleague of mine in St. Paul MAY still have a copy of the instructions.

You can reach Rich Mier on the St. Paul Atari Computer Enthusiasts (SPACE) BBS at 612-427-4317. Tell him Jim Johnson sent you his way.

AW+ traps and uses the warmboot vector (same thing as pushing the reset key) to initialize itself after loading, and to go back and forth between itself and the other modules (spell & mail merge). So you can't simply untrap the warmboot vector.

My patch replaced AW+'s reset trap with my own. I wrote it to patch the version of AW+ created AFTER running ICD's patch to run AW+ with SpartaDOS X. In short, it allowed AW+ to use the warmboot vector once at startup to initialize itself, then it "untrapped" the warmboot vector to point to the standard DOS vector. The short coming of my patch is that you couldn't come back to the editor after going into the spell or mail merge modules. To spell check a document, you could go to the spell checker safely, but HAD to do a document save from within the spell checker. Sometimes the return to AW+ was successful and sometimes not. But so long as you had saved the document, you could always easily reload it.

I don't *think* I ever coded a utility to patch AW+ for you. I never got around to figuring out how to completely solve the above problem with the external modules. To patch AW+ you had to use a disk editor with the ability to do hex string searches (ICD's disk editor from SpartaDOS Toolkit is BY FAR the best tool for this job.)

If you use AW+ under SDX, then contact Rich. Keep in mind that it is illegal to distribute the patched version of AW+, even to other legal AW+ owners. Legally, you must patch, or have patched, a copy of your own AW+.

From: djg0@aber.ac.uk
Message-ID: <1992Nov25.155718.15496@aber.ac.uk>
Source record: 108818

```
Digi-Studio Information
-----------------------

Digi-Studio is a set of programs for the 8-bit Atari (XL/XE) for creating
music using "real" sounds, which have been digitized. The Digi-Studio package
contains everything you will need to create and play music using digitized
sounds. Here's a list of the programs included:

* Keyboard Player. Allows you to play music live by using the computer's
keyboard like a piano keyboard. The sounds produced are, of course,
digitized. This program has fully responsive keys, so that sounds only
play for as long as you hold the key down.

* Tune Player. This program plays Digi-Studio tune files using digitized
sounds.

* Sample Editor. This program allows you to edit sound samples by using
a joystick. It also has "cut and paste" facilities, so you can also create
your own samples.

* Tune Compiler. This program allows you to play Digi-Studio tune files
in your own Basic or Turbo-Basic programs.

* LIDS Compiler. This program allows you to create your own Digi-Studio
tune files by use of a language called LIDS.

Also included are 55 sound samples, and 44 ready-to-play Digi-Studio
tune files.

The Digi-Studio system comes on 2 DS/SD disks. Disk one contains the main
programs and a starter pack of sounds and tunes. Disk two contains more
samples and sounds for use with Digi-Studio.

The Digi-Studio system is also supplied with a 44 page manual in A4 size. This
manual has sections describing all the programs listed, but also has a lengthy
section on how to read music. An appendix has also been added containing
music along with the corresponding LIDS programs.

The Digi-Studio system (with manual and 2 disks) costs just 12pounds+1pound
P&P. In the US it will cost $29.95+$1.50 shipping.

Fill in the form below and send it with payment today!

Sorry about my naivete, but, the XEGS; what kind of carts does it use? The same as the XLs or something else? I've seen one at a local flea market and I'm wondering if I should pick it up.

Thanks,
Brian

4378. Not Reflecting.

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-25 18:14:37 UTC
From: phil@nid.csc.com
Message-ID: <5.UUL1.3#25250@nid.csc.com>
Source record: 108821

This is a test message. This is message #4.
Message/Post #1 was about old source code. (I got the reflection of this)
Message/Post #2 was a thank-you message.
Message/Post #3 was a rewrite of thank-you since I didn't see #2 reflected back
from the newsgroup to my site.
Message/Post #4 is this.

If you are on the internet and capture comp.sys.atari.8bit and did
not receive Message #2 or Message #3 , please let me know. I may have
sent them accidently as an individual reply/email instead of a newgroup
post.(If so I will see if the individuals still have a copy, otherwise
they are lost). On the otherhand if multiple site respond (via email,
not a post) that they did see the posts, then I know that somehow the
PC software (uulink) or uunet may have lost the reflection and that is
why I did not see my own posts.

Thank-you for your time.
Philip Price
Please respond to: phil@nid.csc.com

4379. Atari 130ST and 260ST

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-25 18:37:53 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Nov25.183753.26298@sactoh0.sac.ca.us>
Source record: 108827
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Another comment on an Atari "200", yes, in Europe there was a 260ST. In 1983-84 before the ST line was released, Atari had a center pull-out in the Atari magazines back then introducing the 130 and 260STs with 128k and 256k respectively.

Remember, these were the days that memory was expensive, and the largest home machines were 64k-128k. IBM PC were originally 64k and used tape drives, and the Apple Macintosh was a 128k machine.

So Atari prototyped the 130 and 260STs, with a disk based OS (TOS 1.0)

Also in the pull-out, Atari showed screen shots of the original GEM desktop, that was changed when the 520ST was released.

If anyone would like a photocopy of the pull-out, let me know.

I'm not sure if your using the LVAAUG (or some club) version of Atari Writer Plus for use under SpartaDos, but if your not - get it. Its available wherever find PD is sold/carried (grin)

Also, regarding the R-time 8. Hold on a bit and you'll be able to purchase a knock-off of the R8 from BEST Electronics. I believe they are making a version of their own at a reduced price.

I too really ENJOY (note present tense) AR:Dungeon/City - and hope that not only will the source be released, but the adventure be continued. I would love to explore the prison and castle areas! (grin)

Sure, the XEGS cartridges work well on XLs, actually it's the same
computer as the XE series - just the casing is different.
Go to the flea market and pick up as much of the cartridges as you can. :-)

Wow! Great! Wonderfull! I can't belive it!
It's incredible to have you on c.s.a.8 !
In my opinion, AR - The City was the best ever programmed game for the
Classic Atari. I've bought it around 1987 and I'm still impoving my
character's statuses. I've been looking for the second part of the AR
series, "The Dungeon" for a long time. Finally, just a month ago I got it.
It was still unsealed and brand new. It's kind of hard to get some software
you programmed here in Germany. I haven't tried out "The Dungeon" yet. I
guess when I'll go home for Xmas vacation, I'll have a lot of fun with it.

Philip, thank you very much that you've given so much joy to Atari Classic
users with your incredible games.

4387. programmers wanted

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-25 21:50:57 UTC
From: camba@ecf.toronto.edu
Message-ID: <ByAKoy.5Dw@ecf.toronto.edu>
Source record: 108828

Hello all 8bit users. I am a student at U of T and own 3 atari computers.
I noticed that there are a lot of great programmers out there who seem to
have the capacity to create and develop great games. I, myself, have made
many music programs of my own in machine language, using fancy sounds and
high quality sampled sounds. I have created long 52k sampled demos (re-mixes)
which last almost two minutes, but has very little repetition. Anyway, what
I'm getting at is that I can create awsome music (which will soon be uploaded
to the known atari ftp site) and can make fancy graphics in ML. I was
wondering whether some other people out there can assist in me in making
new games. I will soon have some time available to do this. Let's not
let the 8bit be forgotten and collect dust. The 8bit does have the capacity
to create awsome games... it just takes a lot of imagination and effort.
If you can program like The High Tech Team, then send me e-mail....
I am currently working on a game called "The Dark Shadow.."

e-mail: camba@skule.ecf.toronto.edu
or camba@ecf.utoronto.edu

Re: XEGS...

Looking at it from a computer point of view, the XEGS is an Atari 65XE with an extendable keyboard and built-in BASIC and Missle command. It came with one game, Flight Simulator II. (maybe it also came with the XE light gun and a Bug Hunt cartridge, as well?)

Looking at it from a game machine point of view, it's a game machine with a keyboard you could hook up, that came with a built-in game (Missle Command) as well as a built-in language (BASIC), and game with a game cartridge (Flight Simulator II).

The XEGS can play (use, if you will) all of the cartridges that the 65XE can, and Atari remade a bunch of old titles, as well as making a bunch of new ones (a perfect example is Mario Bros. I have Mario Bros. for the XEGS and play it on my 1200xl, but it's a completely different game than Mario Bros. of 8 years ago that Nintendo made for the 400/800/XL series. The game is the SAME, but the difference between the two is like the difference between a game made for two different lines of computers (like, a C=64 game vs. an Apple II game). Of course, the newer version is better (I've played the old one a few times.) Some new titles (??) that they made include Ace of Aces and Bug Hunt. (if I'm wrong about the newness of these titles, correct me)

thanx

I think it creates a Z: device that programs can use to read the clock.
If BBS Express Pro can read the clock without ZHAND, you probably don't
need to load it. We have a local Express Pro BBS, I can ask the sysop; or
you can. The BBS is at 502-456-4292 (not Pursuitable, sorry!)

> editor)!

But T:EDIT --DOES-- support all 255 ATASCII characters ! Unfortunately, the editor redefines all of the "CONTROL Character" ATASCII graphics to a new screen font, where the characters are in a "computerish" looking font. In this way, CONTROL-A is no longer a lefthanded "T" whose stem points to the right, but rather, a "computerish 'A' " character. The "CONTROL" characters are triggered by pressing a CONSOLE/FUNCTION key. Character values above 127 decimal are generated by pressing the INVERSE/ATARI SYMBOL key, I believe. What would --REALLY-- be nice is to find a copy of the source code and remove the section of code that loads in the "new T:EDIT font", so that the ATASCII CONTROL Character font remains unchanged. About the only advantage that TEXPRO has over T:EDIT is that TEXTPRO can run macro scripts, and TEXTPRO can perform chained loads of a large file into its small editing buffer, but that is one --HECK-- of an advantage. I believe that T:EDIT is a program that originally appeared in A.N.A.L.O.G. magazine. Anyone who subscribed to A.N.A.L.O.G. probably has access to the source code, perhaps. Unfortunately, I do not know the date of the issue in which the T:EDIT editor appeared. T:EDIT is smaller and executes faster than TEXTPRO does, but it as not as powerful as TEXTPRO is. Personally, I don't think the T:EDIT editor stinks. I think it is fabulous! It does screen updates a hundred times faster than TEXTPRO does! Unfortunately, it does not have TEXTPRO's flexibility in handling large files....

Gads! I hope you have the two-tone, brown and tan, vented power supply and not the solid black XL supply with the extra plastic square box with a fuse contained that is spliced into the line. The non-vented power supply blew on me and the "fast acting fuse" was protected by having my 850 interface blow out! The vented, two-tone power supply and the vented, black supply with the silver name-plate on top are OK. If you are using the sealed, black, non-vented ATARI 800XL power supply my advice to you would be to --REPLACE IT-- as soon as possible! Especially if you have an R-TIME-8 or an ATARI 850 INTERFACE attached. My disk drive appears to have been hardy enough to survive my sealed, black, non-vented ATARI 800XL power supply blow out, thankfully.

>version of TextPro and offered to provide a copy of the source code to any
>registered user who paid some extra money for it. ... Anyone know if Mr.
>Ritche ever did release the TextPro source code to anyone?

I have seen the source code to the --LAST-- of the TEXTPRO 4.?? floating
around on a few BBSes. While I could not swear an oath that the source
code is, indeed, an official release from Ron Ritche, I seem to vaguely
remember a notice from Mr. Ritche having been included in the archive. If
I remember correctly, this 4.?? series of releases is referred to as the
"XE family of 'bank using' " TEXTPRO releases, as opposed to the "PLUS
family" of TEXTPRO releases. Currently the --NEW-- TEXTPRO 5.XX series is
under development and in beta release. I don't know what the name of this
new version of TEXTPRO will be called. It is rumored to support an 'IF'
macro statement to test for conditions like End-of-File, etc. .

I was the one who released the code for TextPro 4.56 for Ronnie Riche
something like 8 month ago. This is the officicial code to the last of
the system 4 series TextPro. TextPro5.0x should be at the Archive in
Umich... the update docs covere changes to the Macro Lang.

If you interested, I'll send you a copy of the source code. let me know

Pirating is pirating. That last message had a huge list of stuff for sale, and he'd like to make a profit. If someone were to have available a huge collection of pirated software for FREE, people would just trash their software, no one would make any money, and people would abandon the poor old 8-bits.

Sorry if I sound harsh, but I'm very much against pirating. I still have to delete a copy of POPEYE I got off of a BBS a while back. The Sysop requested someone to download it and inform him if it's (c)'d. I'm almost positive it's not yet PD.

Has anyone out here tried Atari Sampled Sound System (or is it Atari Sound Sample System...)

something like that..

anyways.... it's a handy little program (new, even...1992) that converts 8-bit sounds (used on IBMs, Macs, Amigas, etc... ones with extensions of ".IFF", ".SND", and ".SVX") to 4-bit Atari sounds (".ATS"'s...which are compatible with ".DIG"'s, that Parrot makes... unfortunately, Parrot can't load up ".ATS"'s (I think I need to make a header remover/changer for ".ATS"'s... the ".ATS"-player that came in the ARC plays raw Parrot ".DIG"'s fine.)

Anyways... now my good old digitized sound library is infinite! ;)

Source record: 108854

The following Atari 8-bit stuff is for sale. If interested in anything, please reply to me via one of the paths listed at the end of this document.

Order over $75 and take 20% off the price!

ALL ITEMS LISTED BELOW ARE SOLD AS-IS, with no warranties expressed or implied. Not responsible for any typo mistakes made in this list. All software is in good condition (i.e. I threw out any physically damaged disks I found). ALL (and I mean ALL) items are ORIGINALS, no pirated stuff here! If purchasing manuals without the accompanying software, you SHOULD have the original disk in your possession! It will be assumed that you do.

Orders must be pre-paid (no CODs) with either a check or money order. When ordering, please refer to an item by its number. Since there may be more than one copy of a title, the # will keep confusion at a minimum.

Shipping will be by EITHER parcel post (for small items), or UPS ground for larger orders. Exact UPS/Post Office shipping charges will apply.

Definition of terms found in this listing:

Num = Item number (always refer to item by its number)
Pkg = Whether or not item has its original packaging. Software that did not have its original packaging has been placed in a resealable bag to protect the media.
Doc = Whether or not item includes documentation

Pre-enjoyed DISK-BASED software

Num	Title	Pkg	Doc	Price
35	Ace of Aces	N	Y	$ 4.00

4413. Proposed BBS for 8bit warez AND stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-27 05:49:56 UTC
From: ekarlin@csws20.ic.sunysb.edu
Message-ID: <1992Nov27.054956.15957@sbcs.sunysb.edu>
Source record: 108853

I would like to ask the .8bit world a question or two.

First...I have recently set up a BBS on my Amiga for PD amiga files
and 'Adult' files that I have aquired over the past few years.

Well- What I was wondering is if anyone would be interested in me
bringing my atari 8bit files over to my amiga, as a dedicated file
area.

The only thing is that probably 99% of these files I have are pirated
games that I aquired back when the 8 bit was popular. I got almost
all of my games through local bbs that were around back then.

Anyway, the problem is that I like my computer, and am not willing
to risk it being confiscated because of any pirate 8bit software
that would be on it...

Now-I haven't done anything as of yet...so you won't get the number
right now...but I'd like to hear, either here or email, on whether
anyone:
a-is interested
b-thinks its a good/bad idea
c-would actually call
d-thinks I'm doing something wrong.

All I know is that I got all my games from BBS's...I don't see a
large supply of these files anymore...and I certainly don't see
many boards supporting the 8bit anymore. And, my stuff is just
sitting there not doing anyone any good.

Second...if noone is interested in the previous stuff...is anyone
interested in buying any of my old stuff:
I have all the original packaging and manuals for the hardware and
for the cartridges.

400/800/130xe
Indus GT/Happy 1050 with case/sw for indus & Happy sw for 1050

4415. Plugging things to joystick port

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-27 08:57:55 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Nov27.085755.5539@aber.ac.uk>
Source record: 108756

You should try and get hold of back issues of Atari User (the UK one). They ran a long series of articles on building all sorts of devices to plug in the joystick ports, including a mains controller, and loads of other things. I built a couple of things myself!

Dean Garraghty. djg0@aber.ac.uk

4416. Re: Proposed BBS for 8bit warez AND stuff for sale

Newsgroup: comp.sys.atari.8bit

From: bbs@neb
Message-ID: <1992Nov27.094502.20533@neb>
Source record: 108757

I, for one am always glad to see another 8bit supporting BBS emerge. Not too sure if many people will be thrilled about your 'pirate' files, though - but I have my own philosophy on that, and would rather not go into it..

How much would you sell your system for? Would you break it up?

Don't know about the Sega, but I rewired an XE light gun to work on my Amiga by changing the lead, and soldering an extra line to the microswitch, which has two complementary outputs (very useful :). Since the signals for the different computers go to different pins, there was no conflict (ie the light gun worked on both systems).

Well, I had a 260ST. The only difference with the 520, if I remember correctly, was that the drive and the keyboard were sold separately. It had 512K standard, as did the 520.

There is no 130ST, this is a 130XL, which is basically more of a high-end 8 bitter. It did have sort of an ST casing, though. And frankly, the graphics and sound were not too bad at all, compared to an ST.

There was indeed, there still are even. I still use my original 260 ST (dated September '85, if I remember correctly) and original monochrome monitor. It has survived two ROM upgrades (to 1.0 and 1.4) and one RAM upgrade (to 2.5 Meg), one self-built TV-signal modulator and several MMUs. Oh, before I forget, the single-sided diskdrive is still with me, but I no longer use it.

>So Atari prototyped the 130 and 260STs, with a disk based OS (TOS >1.0)

I don't know about the 130. But not only was the 260 prototyped with a disk-based OS, it was sold with a diskbased OS, version 1.0. I still got the disks, and the original two ROM-chips. But, it was no fun having only .5 Meg and using some 195 K for the OS. So I bought TOS 1.0 on the six ROMs and stuck 'm in.

I really can't remember the difference between the 260 and the 520. Was it that the 520 had TOS in ROM (.5 Meg - OS = .25 Meg?)? Was it that the 520 came with a double sided disk-drive?

NOO! Well, I have my good'n'old 520 ST, which I bought Summer 1986, but then it had been out a while in Norway. It came with .5 Meg, TOS on _disk_ and with a single sided drive.

But as far as I've heard (another rumour :-), the 260 and 130 were initially designed with 128 and 256 Kb, but then Atari changed it's mind. I even heard that some 260 with 256 Kb were sold in Germany before the upgrade to 520 came. Can anyone fill out or rule out anything of this ?

Jarle.

Michael,

There was an excellent set of articles in Analog magazine way back called Atari Zucchinni where the author went into a lot of detail about how to get the atari joystick ports to drive all sorts of devices. He talks about running motors and controlling AC 110V devices and all sorts of good things. If you have an XL or XE, the Microport Experimenter's Kit from Best Electronics might really turn you on. It plugs into the Parallel bus and has a PIA which offers you two 8 bit I/O ports plus 4 other handshaking lines. There is space on the board for adding your own circuitry, as well as space for a DB25 connector which brings out all the important lines from the PIA chip. I've got one, but haven't purchased the parts for it yet. The board as purchased does not come with the parts, but I believe BEST can supply you with everything you need to get it working.

That article talking about all the problems with SpartaDOS and SD-X really caught me by surprise. Never before had I heard of all the bad things this guy was saying about the Sparta series. I even talked to a few long term Hard drive users who have used SpartaDOS continually for a long time and never experienced these problems. I have used 720K floppies for several years and also have never experienced these problems.
Is all this myth? Can some people stand up and attest to what this article said? I'm not saying Miguel is a liar, just that his article is the first report I EVER heard of these things.

Lance,

I called Micromiser last month. They no longer support their 8 bit programs, and couldn't provide a copy of turbobase even if they wanted to, they are totally out of stock. I called Toad Computers, B&C, ATV, and BEST looking to see if anybody had stock of Turbofile, and they didn't. The guy at B&C sold the last one a few months ago, but said sales were always sluggish, maybe 1 or 2 copies a month. To me, turbofile is the best Database program I've seen, and Atari Classics wouldn't be here without it! Atari Classics is still run from Turbobase 80, the mailing list is now being run by the managing editor.

Perhaps it should be considered by some party if it would be possible to purchase the rights and source code to the Turbofile/Turbobase/Turboword+ programs...

Well, opinions are like A**holes: Everybody has one & they all stink<g>.
That being said. I don't think it's a good idea to put up any pirated
files. Why risk your computer & reputation for some old games that most
8-bit users probably already own. I admit I was lucky enough to have
money when most of the 8-bit stuff was dumped for $5 to $10 a cart &
bought everything that was available so I doubt you could put up anything
I [don't own, would like to own]. It's great that you want to continue
8-bit support, but putting up games that most people already own at
the risk of losing your computer is more then any user can/should ask.

Just my opinion<g>.

4431. Re: Plugging things to joystick port

Source record: 108769

For some reason <creeping senility I guess>I hung a lot of stuff on
joysticks. Serial A/D chip, my verbose RS232 hacks, flood lights. I
think the only project I didn't finish was a single joystick printer
interface. Turned out when I canabilized the connector to hook up
a printer to the 2nd PIA chip I added I found out I'd hooked up the
!STROBE to the wrong pin of the connector AARRRRGHH! Anyway, if there's
anybody that doesn't have a 850/PR:/XEP to hook up a printer, I can
take another look at it. Bread board is still around here somewhere.
It's a single serial to parallel chip, 74LS164, with a couple of connectors
DB9 & centronic. About a $5 project & gives you the advantage of 8 bit
wide data vs the older 2 joystick designs that only used 7 bits.
BTW: I don't think I'd be willing to write a real handler for the thing.
Maybe just a Basic program so you could take a disk file & send it
through the port.

Although there are many old pirated software out there, there are still some new games/software coming in from all over the world. I, for instance know many programmers out there who would not appreciate piracy. I plan on making games myself, and if I plan to sell them, I would not be happy to see the games a few weeks later on a local board. There are many New games out there created by great programmers. Piracy only discourages these programmers to continue to provide software for the 8-bit. As far as OLD games are concerned, I read in a mag that Atari corp. was thinking of releasing all the copyrights of old games, since most of the companies are now extinct, and some of the games can't be found anywhere. I don't know what the final decision was, but it was an interesting concept worth investigating.

The 68000 Man.

>sanders@sci.kun.nl

Nope, there *was* a 130ST. But it was basically a beta-release of the machine.
This was *really* primitive, it didn't even have enough base-RAM to run
TOS without a RAM upgrade!! Upgrading it to 256k let you run programs of
about 50k in length!!

It was a pretty sad machine - why Atari even *thought* of releasing such a
thing is beyond me. Although it never (along with the 260ST) made it onto
the commercial market!

TOS 1.0, 128k of RAM, external disk drive, no RF-Modulator (but no one actually
uses them right 8-) What a great machine... *NOT*!

Although, compared to the 800XL, it was an improvement! (Ahhh... Those were
great little computers those things!! Great games like Dropzone,
Biffdrop, Montezuma's Revenge, Jet Set Willy.... A lot of which have never
been duplicated on 16/32-bit machines. (There are rumours about a
ST version of Jet Set Willy, which'd be worth looking out for, very simple,
and very wierd game!)

I would advise some caution in dealing with Chris Wiliams. I've done many deals on the net with no problems except for the one time I dealt with Chris. He misrepresented what he was selling, demonstrated lack of good faith, shipped COD with a much higher amount than agreed upon (this was probably an honest mistake, but he still did it), shipped only part of what he promised, shipped defective merchandise - (junk really) as fully functional, and generally made me regret dealing with him. If you want more details, please email me.

Mark

PS I think that the ST chip set he is selling for $29 came out of one of my STs. He gave me $15 for them.

4440. MegaBlast game

Date: 1992-11-28 13:52:23 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Nov28.135223.291@aber.ac.uk>
Source record: 108779

I have just posted MegaBlast to the archive. This is a very good game from Poland (I think!) which has a digitized sound track for 130XE users! See the file mblast.txt for details at the archive. The game itself is in mblast.dcm. Both are in New at the moment. Although the games uses some flashy techniques to have the screen on during playing the music, and other weird things, it works on NTSC systems with no problems!

BTW, I have a demo for Antic mag from ages back which is a Price/Gilbertson production with music, lyrics, graphics, and all sorts of things. Does anybody want me to put it on the archive?

Isn't it plain illegal to advertiser one price, and then when someone goes to buy it, say the price is now higher? I thought I recalled some item by the Better Business Bureau stately some such info....perhaps I mis-remembered.

I am thinking of purchasing Super Database 1-2-3 for use on my
800xl(Rambo 256k), with Blackbox/Floppy Board/Hard Drive...
Before I go blowing antoher $60.00 on something that I really didn't
need, could someone please tell me what they think about this program?
Is it worth the price? Will it do a reliable database job? What are
it's limits as to file size? Soes it support Sparta 3.2d and subdirectories?

I don't expect answers in detail to all of these questions..but any info
is wlecome..

Thanks

4445. Good ideas/help for setting up BBS Express!

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-28 19:12:51 UTC
From: phbill@cyberden.uucp
Message-ID: <58qyuB1w165w@cyberden.uucp>
Source record: 108787

I just got a copy of BBS Express! (c) 1986 - Keith Ledbetter... so it's
no BBS Express! Pro or anything fancy like that..

Here's the deal..
I'm running it with this setup:
1200xl
1050
1050
MyDOS 4.53/4
SX212 modem
BobVerter 2.4 R: device handler
Express! 850 (verses the 1030 version)

The problem is, when it sends data to them modem when it first starts up,
it sends at 300bps, thus locking the modem at 300bps. Then, when it
receives a call, the modem hangs up on them before even getting a chance
to connect, and the BBS still thinks it's connected! Argh!

So... where I'm standing, >I< think these things could be the culprit:
Wrong modem handler
Wrong DOS to use.
Wrong version of Express! (ie-I should get the 1030 version)
Can't be done at all.

Well? What do you people think? Thanx in advance for any help.

Please, *PLEASE* note that this is NOT ME. Ever net.deal I've ever done
(both buying and selling) has come off rather smoothly, except for
a bit of delay with one deal, which was entirely my fault, and the
buyer didn't even mind terribly. I *do* wish you'd post the address
of the 'other' Chris Williams, instead of not telling us who he is.
[It's CERTAINLY not me! the only Atari equipment *I* have is an
old Atari 400 (which, btw, if you're interested, send mail)]. IMHO,
it's just not fair to _me_. There are several of us Chris Williams'
out on the net (one in the UK, one on the east coast somewhere, I think,
and now this one (and me)). It's not fair to ANYBODY named 'Chris
Williams'.

Thank you,
-cgw-

Message-ID: <1992Nov29.000919.18220@mnemosyne.cs.du.edu>
Source record: 108785

That is because Bob Wooley's issue was sent by Ben, first class.
First class mail takes about 5 days to reach people, while 3rd class
mail takes up to 4 weeks, especially to CA and NY, where the population
is the densest.

We have received back a number of issues because peopl have moved.
If you moved, and didn't tell the post office you would pay to have
your third class mail forwarded, your issue of Atari Classics was
thrown away. All we get is a slip of paper with a new address on it.
Replacement issues will be going out sometime; I can't say when.

I've just recently purchased the registered version of DD3, and am having a bit of trouble inserting gr9 pictures (as fonts) into my documents.

Seems like the docs on the conversion utility (gr9todd3) suggests that you first load in the font:
\FD3:>dd3>fonts>tiger\ and then you do something like:
!"#$%
&'@(

How exactly do you know WHAT series of keys to hit after loading in the font? I can get my pictures to print out, but usually in multiple peices - and not as a whole.

Any help on this greatly appreciated too!

4452. Project (Read It) !!!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-30 09:14:49 UTC
From: rossi@opal.cs.tu-berlin.de
Message-ID: <1992Nov30.091449.26248@cs.tu-berlin.de>
Source record: 108789

Hi folks !

Here is --==rossi==-- calling.

I discovered this newsgroup few weeks ago.
I've been an XL-User for eight years (or so) and quite reasonable
programmer in BASIC,ASSEMBLY LANGUAGE and PASCAL.

Up to 1989 there were lots of people discussing 8-Bit-problems and
publishing programs and articles for the 'little' ATARI computers.
In 1990 ATARImagazin, the last german XL-supporting magazine, quits
(and I wonder why it is listed here in FAQ) and I guess ANALOG did
it, too.
There was still the Compy Shop Disc Magazine (CS-Mag) with a couple
of great articles about OS,Hardware,DOS,fractals,PASCAL,SPEEDY and so.
But in middle of 1990 Compy Shop stopped the Mag because of software
piracy.
So there was no way for German people to get new ATARI XL/XE stuff
(okay, there were a few clubs, but nothing of interest). That's because
most guys with great knowledge about XL-computers had new computers
at home (as you maybe know the ST is bestselled here in Germany).

At this time I programmed and prepared some 8-Bit-projects and most
of them were finished until end of 1990. But some others stayed untouched
or were never finished because of (a) leck of time (b) other preferences
(c) new computer (d) university stuff.

Now its more than two years ago I wrote my last program for the ATARI
and build my last hardware for it. All the articles lay there collected,
sorted and unread for this two years.
The Xl never left the table and yesterday I sat down for the first time
and tried to remember some of that stuff. I looked to some of my former
ideas and found something interesting.

I own an ATARI 800 XL with a 1050 disc drive. In this floppy there is
a speeder called HSB (High-Speed-Board) which is compatible to the HAPPY
(I guess). There are dozens of programs referrings to all kinds of disc
speeders. There are copy-programs, slow-speed-prgs, Disc-Maps, DOSes
and many more. There is also (from HAPPY) a program which allows
to put two boot programs on on one disc.
This is allowed if both programs are 'small' enough that they allocate
together not more than 40 tracks on disc. A special loader is put in
front of them. This disc is not compatible to anything and I think most
programs don't work with it for various reasons (maybe they read/write
a special sector or don't work with DD etc.).

An idea was born.
How about putting two full single density (SD) disc on one DD disc without loosing information and without crunching. How about to do it staying compatible to used DOS format (DOS 2.5, MyDOS, Sparta-DOS, BIBODOS or whatever).

In SD there are 720 sectors each with 128 bytes on a disc, in DD there are 720 sectors each with 256 bytes on it. No problem you think...?

1.problem : Even in DD the first three sectors have 128 bytes, if you use a sector-read routine from DOS or something similar.
So you can't get two full SD disc together ?
I think you can do it. The first three sectors are on the first track on the disc. This track has the same length as the others which have only sectors whith 256 bytes. So on the floppy disc there has to be room for 2 full SD-discs.

2.problem : How to put 128 byte sectors on a DD disc ?
It's as easy as it seems. Read the DD-sector from disc. Place it into a buffer (in the floppy). Put the SD-sector in the first 128 bytes of the buffer, if it is DISC A, put it in the last 128 of the buffer if it is DISC B.
Save the DD-sector.

3.problem : If DOS (or something else) reads such a 'shared' sector nothing but sh*t will happen.
That's right, but that is the project. To program some floppy speeder (those with allowing DD) in that way, that they know when such a disc is in the floppy and that they react in the way, that they make a difference between DISC A and DISC B (more about it later on).

4.problem : A floppy isn't able to make a difference between a normal DD disc and a disc with 2 SD discs on one side.
It is able. On one of my PD discs at home I have a program for a HAPPY drive (and other speeders) which shows on the screen if the floppy is closed or opened without reading or looking for a disc.
All the program has to do is each time a disc is in the floppy to read sector 1.
Why ? Oh the first byte of sector 1 is unused (It's zero forever) because of later expansions (haha). Okay, this project is such an expansion.
Write down a $FF to the first byte of sector 1 of each disc with 'shared' sectors and ask for it when a disc is put into the floppy.

other problems : later ...

Still there ? Allright then...

What do I want ?

I have a lot of discs with boot programs on it. Most of them are in the
normal Single Density (SD) format (720 sectors a 128 bytes) on each side of
the disc. I want to put two of those boot programs (two of those sides)
together on one side of a Dual Density (DD) format (720 sectors a 256 bytes)
disc. This format can be made with some floppies like INDUS drive (??) and
the ATARI 1050 drive expanded by a floppy speeder like HAPPY, HSB, SPEEDY
or TURBO 1050. This expansion has to be programmable.

What is the advantage of it ?

Free disc space, no more changing sides (like Alternate Reality(I solved the Dungeon)) of
discs,more room in your disc box etc.

Who will do it ?

It will cost me month to re-know all the details (of programming floppies and using free
RAM in ways that other programs won't be disturbed). So here is
the question to YOU ?
All you famous programmers and great ATARI freaks.
Here is a challenge for Y O U !!!!!!!!!!!
So contact me...rossi@cs.tu-berlin.de

How it may be done ?

There are some details mentioned before...
For some reason you can't set this new program in the normal computer RAM.
(Reducing RAM capacity, all Resets and RAMclearings will kill it)
So you have to program the floppy controller of the speeder.
All of them are pre-programmed in a way that they can produce DD, format a
disc, read/write sectors and so.
The Operating System of the ATARI uses this floopy always in the same way
(not the OS but the DOS). So if you re-program the floppy, DOS will not
know it.
But there has to be a little hardware work too.

You have to change the format routine, the read sector routine and the write
sector routine. You will also have to add a CHECKDISK routine.

Format :

a) formatting a disc in SD,DD (and MD also)
b) clearing DISC A/B - 'zero' the first or the last 128 bytes of each sector
of the disc. Remember to put a $FF to Byte 1 of sector 1
when clearing DISC A.

CHECKDISK :

* Check out if a disc is in the floppy drive.
* If so then READ SECTOR 1 and GET BYTE 1
* If Byte 1 is $00 then ignore all changes:normal disc
* If Byte 1 is $FF then enable all changes:project disc
* If Byte 1 is other than $00 and $FF then wonder and continue

Read sector :

If it's a normal disc then work as normal.
If it is a special project disc then do the following :
Check out sector number
If it is 4 or more then read this DD sector and give the first or the last
128 bytes to computer
If it is 3 or less then read the complete first track and locate the DD sector
in it. Now continue as if it was another sector.

Write sector :

It is similar to the Read sector routine but know that
every time you write a sector to disc you first have to read
it from it because there may be information on it which elseway were
destroyed.

Hardware :

There have to be two new switches at your floppy drive.
One says if you use DISC A (first 128 bytes per sector) or DISC B (last
128 bytes per sector). It has to be installed on a free pin where a routine
can get information directly everytime before accessing disc.

The second switch is there to rule the formatting. It says whether you
format a disc the normal way (rrrrttt,rrrrrttt,rrrrttt) or clear DISC A
or DISC B by zero sector parts.

These switches are necessary because you can't do it by program in your
ATARI or in your floppy (because no input chances at the floppy).
Remember this situation. You own a program which is saved down on both
two sides of a normal SD disc. On the first side is a loader whith
graphics and sounds or whatever. This program asks you to put side 2
of the disc in floppy 1. No chances for a program to stop and send a
signal to floppy which says: Now please DISC B. So if you do it by
program you can't put this two sides together.
If you do it by hardware switch and such a program ask you to put
another side in the drive just push the button or use the switch and
continue with your work.

What is the name of this project ?

I'm not sure.
Maybe ATARI DCD System (DCD for Disc Capacity Doubler) sounds not bad
Even DDP is not out of the game yet (DDP - Disc Doubler Package).

What to program for this kind of system ?

There must be few programs for this format so this format is it worth
to get.

+ the package itself
+ a formatter (with all features)
+ 4 copy programs :
SD-discs to DCD system discs
DCD system discs to SD-discs
Files of all formats to DCD system DOS-discs

DCD system DOS-discs to discs of several formats

If you want to read more about it or if you need more infos (about disc speeders or etc) to make such programs, please loose no second and contact me per Email (rossi@cs.tu-berlin.de).
It would surprise me, if noone of you guys is able to do it with some help of mine (or without ?).

Thanx a lot for your patience....
--==rossi==--

Wanna hear about some other projects ???
Lots of stuff is waiting to be cared of....hehehe

4453. Textpro V 5.0 update

Newsgroup: comp.sys.atari.8bit
Date: 1992-11-30 09:24:28 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92335.042428JJMCWILL@MTUS5.BITNET>
Source record: 108706

Okay, I called Ron Riche, author of the Textpro wordprocessor/Text editor yesterday, Sunday, at about 5:00pm. Here's basically what he had to say.

Textpro version 5.0x has been in circulation for a while, which is what I believe is currently available at the archive. This version contains new Macro features, but the documentation for accessing the "Machine Language Module" feature was not published. This was because Ron first wanted to see if any bugs appeared in 5.0x before setting down things in stone. Due to the nature of the 6502, programs on the Atari (and thus Textpro and the modules) aren't very relocatable. In Ron's opinion, it would have been a bad move to publish the locations of the machine language hooks and the Textpro equates, have people write some modules, then find a bug necessitating a fix to Textpro, which could shift some things around in memory, thus causing current modules to no longer work.
Better to fix all the bugs inherant in the program itself, then release the documentation and let people start programming away.

According to Ron, the final, official release of Textpro, along with program hooks, variable equates, and all the goodies necessary to write machine language modules for the Word Processor, will be released sometime in December. Ron still has 18 disks containing the interim release 5.0x which he hasn't had a chance to mail out. This pile includes my copy. I mailed him my $40.00 back in March of 1992, and he said there is no rhyme or reason to his method of who got mailed the disk at what time. So if you are still waiting for a disk from Ron, perhaps it's in the pile of 18 that has yet to be mailed.
The disk basically contains the same stuff Mike uploaded to the Atari archive. As I said, the final release, allowing Machine language modules, will be released soon. (fingers crossed).

I am really looking forward to the final release. The source code and machine language module capability means you could do some really interesting things with Textpro, like modifying just the print routines to add specific printer features like graphics or scalable font support, or adding a spell checker module, or some sort of support for 80 column displays. Tom Hunt of the Closer To Home BBS says he is interested in writing Textpro modules, and judging from his previous programming efforts, I believe thiere is a good chance we'll see interesting things emerging from CTH.

As in many things, patience is the key. Hang in there.

Jeff McWilliams

4454. Antic AMP demo

Sanctuary 2 ** 11.4 Private
```

Dungeon Theme ** 11.4 Private
Alone in the Dark**11.4 Private
8 voice two Atari 800 versions of AR
theme song -Not released
* song marked with a single star
are avaiable on the repective games
Datamost who we did these for, long
time ago failed to live up to the
contract and I feel letting out
the songs we did for these games
is legal and will not harm thier
sales if they are still being sold
after the 4 years have past.
Recondocheckerboard is a unfinished
out of sync song gary wrote for a
Vietnam game we never produced.
FACE is also for a game we never produced
ALTREA was a song Gary discarded
that
was a first cut for a AR theme song.
It is nothing like the real AR cheme
song.
** The private songs are private due to
contractual restriction because even
though the AMP is not being used in
AR - The dungeon (a more generic
inferior 'VAMP' is instead) a
derivative of those songs are/may be.
Some of those songs that use 11.4
are
Gary's best work so far.
Passionatly is one of Gary classic
orignal songs. There are probably
a dozen songs I have left out, But
that's life.

Brief History Of Philip Price
Wrote interactive real time
computer games in 1974-75 for the
fun of it on mainframes at
Huntington Beach High School
Then college and more games for the
fun of it.
The 2 years Navy as a Electronic Tech
and Nuclear Reactor Operator
Started with Gary Gilbertson
Paradise Programming Inc.
Authored a shootem-up call The
Tail of Beta Lyrea (Electronic
Games nominated it for best

audio visual effects etc)
AMP 3.0 comes out
Created a
hard Disk driver for University
of Hawaii that was interfaced
with there
Atari's in Hilo.
Then came Further versions of AMP
Alternate Reality the City is created
AMP 11.4 comes out with
redefined character sets
and fonts
and full screen lyrics.
AR - the dungeon is half finished
AR - the dungeon is lost by Datasoft
I leave the game business
Take job as software analyst with
Computer Sciences Corporation

Gary Gilbertson Brief History
Got Bachelor degree in music theory
Airbourne US ARMY Vietnam - Bronze star
Afterwards was a member of the
second most popular band in the
state of Hawaii in early 70's
Ran into me at a computer store
and we start Paradise Programming.
He wrote many beutiful original
songs.

Gary writes great songs, which I love to
play again and again. I love music
but don't have Gary's talent of
songwriting. If you like Gary's
music please write to him in Hawaii
I am sure he would love to hear from
you. You can also write me if you want
, though I am notorisly poor at writing
back, I cherish each letter received since
they are Gary and I's best reward for
the work we have done to create
something that you would enjoy.

I can be reached at
Philip Price
401 W. Pine #77
Lompoc, Ca.
93436

Gary can be reached at
Gary Gilbertson

c/o Paradise Programming, Inc.
P.O. Box 2634
Kailua-Kona, Hi 96745-2634

If you would be interested in a disk
or two full of christmas songs using
AMP 11.4 and some original songs using
same amp, and think it would be worth
$10 or so. Mention it to Gary in a
letter. I think he going to do it
but your support of the idea (No money
yet please) would be an encouragment
to him and me.
I hope the effort
we put in these products
brought you some enjoyment
and happiness. If so they
were worth it.

Take Care,
Philip Price

I think the problem is the type of modem that your using. The reason I state this is because I didn't see nything about using a interface for the modem. I know that Express PRO also won't work with an SX-212, but it is possible to get the program to run, but not accept calls because of conflicts in the SIO port.

Here's what you need to do. Use the 850 version of Express and use
Bobterms R-handler for your SX-212.

Make sure you specify 1200baud in the sysedit program prior to booting
up. I would suggest SpartaDos over Mydos - as I dont think Express ever
supported MyDos (but I could be wrong).

Use those tips and I'm 99% sure it will work for you.

Source record: 108791
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

All this reminicing about old computers got me thinking about the
"Rumored 64 bit Atari Game Machine" My bet is if this thing ever sees
the light of day it well just be two SLOW 68000s in a box. I really
believe it may come out since Atari Sunnyvale has been advertising in
the paper for 68000 assembly language programmers. Despite the success
Atari is still having in the game field (34% of all Atari sales) they will
probably just use it as a dumping ground for parts that were bought/intended
for ST production, but left over when sales of that machince dropped off.
We'll see when it comes out *IF* it has the same part numbers on the chips,
uses 256k DRAMs, & no surface mount parts. Not that there's anything wrong
with two 68000s in a box running at 8 mHz. It'd compare favorably with the
other stuff it's competing against. & there are a lot of M/L programmers

I can confirm that the ATARImagazin exists again. Since september 91
a new issue is released every second month. The magazin has about
60 pages and covers themes like QUICK, TextPro, Games, Letters and more.

BTW: I'm one of the authors of the magazin - mainly QUICK stuff.

Source record: 108705

In about 7 years of using Sparta DOS I've only lost one disk with a scrambled directory. I could say for sure if it was Sparta or me bumping into Sparta if I could duplicate the error, but no luck. maybe I just banged to hard somewhere where I wasn't supposed to. IMHO: And I don't mean to sound to sane, if there really was a problem/is a problem with Sparta someone would/should tell how to expose the problem. Like Basic B adding 16 bytes of garbage to a saved file. I've heard a couple of dozen people trash Sparta, but not one that could say something like, "Try to put 129 files in a directory & it'll corrupt the disk." It's funny because I lost my MyDOS distribution disk due to it confusing D1: with D8: (My fault, I wanted to check a Rambo with their 256k upgrade ramdisk handler =>mistake!) I also lost one to sparta when I plugged in a 1.4 meg & tried to format it. After plugging a 720k drive back in W/O powering down the drive, when I did a DIR the drive proceeded to format the disk I had in the 720k drive. Admitedly a user error. I've also made a couple of mistakes with 5.25" 720k drives, but they were definately my mistakes, like forgeting to set the switch to double step tracks when I insert a 40 track disk. None of these seem to indicate anything other then when you do something really stupid, you can screw something up. Now I'm all in favor of doing really stupid stuff every chance I get, but if these people are really losing THAT many disk, they must be doing.... well <g>.

For all intents and purposes, almost anything that the 400/800,
600XL/800XL/1200XL, 65XE/130XE can use, so can the XEGS. Programs,
disk drives, printers, modems, almost whatever.

(Exceptions of course are PBI devices, and programs that are 130XE
specific)

I'm glad you brought that up...

The board you want is Closer To Home (CTH) run by Tom Hunt.
his number is (419) 368-4413.

The last time I'd looked, he had a number of patches for Sparta 3.2d, I believe the current patch level is "z"... Hope this helps...

>I'm still trying to figure out the 'basics' of Textpro. As I was
>flipping through my printed-out docs, I noticed a section relating to
>bank-switching. How can this be accomplished? According to my docs, it
>says hit CONTROL B to jump between two documents, but hitting those keys
>has no effect.
>

Okay, first you need to set up the bank select... You do that by hitting
Select-Control-B You will be asked if you want to set up extended banks...
type Y then you will be asked if you want to clear the banks... Y again.

Now, Control-B will move you between banks 1 and 2... you use the Select-
Control-B to move between the Main bank and the extended banks... you can
also use Control-T M to return to the Main bank at any time.

What you have is three 15k banks, you can have either three files in memory
at once or using the Select-G control can split a 45k file between the
three banks for printing.

Most of this is found, I believe, in Addenda B to the docs.

Hope it helps...

This is true, ATARImagazin was actually reborn around late 1991 (?).

4 weeks ago I've received the latest issue. It's a very interesting
52+ page magazine with programming corners, new software and new
hardware reviews etc.

Right now I've subscribed for the next subscribtion period until
mid 1993.

As you see, Germany still has it's XL-supporting magazine.

> where do I get the stuff?
>
> --
Umm... Felix,

Well, the MIO provides a SCSI/SASI port for connection hard drives.

SCSI/SASI describes the interface between the Hard Drive and the computer.
Other possible interfaces to be found on Hard Drives are as follows:

MFM
RLL
IDE
ESDI

If you want to use an MFM or RLL hard drive on your computer, you need
a SCSI to MFM or SCSI to RLL controller between your MIO and Hard drive.
Two popular ones are the Adaptec 4000 and Adaptec 4070. Both of these
are sold by Computer Software Services.

You will also need a case and power supply to mount and power your hard drive.
You can usually get two styles, a SHOEBOX case, or a under the monitor type
case. Most can be purchased with power supplies already in them.

You will also need the proper data cables to connect between either the MIO
and SCSI/SASI hard drive, or MIO<->Controller<->MFM/RLL Hard drive.

Once you have the MIO connected to your 800XL, and your Hard drive connected
to your MIO you need to physically format the Hard drive. This is done
with software. ICD has Hard drive formatting programs, but not all SCSI
hard drives are supported, best to check with them before you purchase
a hard disk.

Next, you need to set up Partitions on your hard drive, and use an appropriate
DOS. SpartaDOS or MyDOS are the recommended DOS's to use. I think both
allow a maximum partition size of 16 megabytes. So, if you purchase a 20meg
drive, you might want to make two 10 megabyte partitions, each will be
seen as a separate disk drive by DOS.

That's the basics, the MIO manual goes into all sorts of gory detail about
the specifics.

The documentation for GR8TODD3 should thoroughly cover which characters
to use when turning a graphics picture into a font. I used to use the
DD3 system extensively, until I purchased a 24 pin printer and discovered
that it no longer worked (sob, sniff sniff).

Another Atarian in Karlsruhe??? I own an ST and an old 800XL, do you know where can I get a cheap 1050 diskdrive or better around this city for my XL? Do you program for the 8 bits machine?

Michael,

I tried emailing this, but it bounced, and A finger or Marshall
at your site says you didn't exist. Oh well.....

To my knowledge, you need to have true double density (180K)
in order to use any of those IBM disk reading programs.

To hook up a hard drive to an 800xl, you need the following hardware
items:

Hard disk (whatever meg capacity, SCSI preferred)
Hard disk interface (Mio, Blackbox or K-Products)
Hard disk controller (Adaptec 4000a preferred)
50 pin ribbon cable (to an interface)
Case w/at least 43watt power supply

Total cost for a ready-to-run hard drive setup will be close to $400.00
unless you can find one used for much less.

I will have one for sale (20meg St-225 w/K Products HD interface and
Adaptec 4000 w/case & power supply <ready-to-run>) for about $300.00
plus shipping (or best offer)

James King writes:

>Help! Can anyone provide me with information on how I can FORCE LF to ON
>with my 850 interface? According to the 850 documentation, LF is set to
>OFF via factory settings.

Boy, James, if you find out anything, here or elsewhere, about any way to change the behavior of the 850 through any kind of user-accessible mechanism whatsoever, I'd sure like to hear about it! It has long been the bane of my (and a lot of other Atari 850 users') life, that translation of the ATASCII EOL character (ATASCII 155 decimal) to ASCII CR+LF (ASCII 13 decimal, ASCII 10 decimal), apparently takes place IN THE 850, and CANNOT BE TURNED OFF. Such translation is necessary, of course, to make Atari TEXT files print properly, but screws up 8-pin GRAPHICS printing and forces would-be graphics-dump-programmers to take all kinds of torturous backroads (none of them perfect) to work around this behavior.

This particular behavior, incidentally, was the *only* thing I *ever* attempted to telephone Atari Technical Support about, back in 1984 or so. I NEVER got through to ATS -- during business hours I ALWAYS got a busy signal, and after hours I ALWAYS got a recording saying "call back during business hours." I even went so far as to log a trouble call with AT&T in the hopes that there was something innocently wrong with Atari's phone lines; the AT&T service operator said there'd ALREADY been one or two HUNDRED trouble calls logged for those lines, and that they were still looking into it. I figure SOMEBODY SOMEWHERE was lying or just stupid: either Atari was busying-out their lines (to simultaneously "make it look like we're really busy handling technical support" AND "not actually talk to any customers"), and possibly bribing the AT&T repair department into playing along :-), -OR- the message just wasn't getting through that there was trouble with the phone lines. I *cannot* believe Atari Tech Support could be THAT continuously busy at ALL hours of the day and night -- literally from the MINUTE the work day started, to the MINUTE it ended, EVERY day, for MONTHS on end. I have an audio tape of myself trying-and-failing to reach Atari, and subsequently talking to the AT&T repair operator, and her telling me about those hundreds of outstanding trouble calls on Atari's line... It's a classic...

Anyway, I'd be interested in anything you, James, or anyone else, can come up with about modifying the behavior of the Atari 850!

Mail sent to comp-sys-atari-8bit@ucbvax.berkeley.edu has bounced on me
twice in the last two days, so we'll try this route...

The 8-bit Atari
Frequently-Asked Questions List
for Usenet/Internet

Posted on or about the first of the month, simultaneously to:

comp.sys.atari.8bit and the Info-Atari8 Digest
------------------ ------------------
(the Usenet newsgroup) (the Internet mail-list)

which are, in fact, one and the same group.

Revised 17-Nov-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All postings to comp.sys.atari.8bit automatically appear in the
Internet's Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All contributions to the Info-Atari8 Digest automatically appear
on Usenet's comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning,
jrd@atari.archive.umich.edu.

How do I download files from the archive?
Two methods:

1. If you have FTP access you can FTP to atari.archive.umich.edu
(141.211.182.23 or 141.211.165.41), login as "anonymous" and type in your
e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit
directories. If this is your first visit to the archive, be sure to download
the file -read-.-me-. Other files of interest are 8-bit.cat, containing
1-line descriptions of all the files available, and 8-bit.text, which contains
paragraph-long descriptions. Be sure to have file-type set to BINARY when
downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is
atari@atari.archive.umich.edu. If you are a first-time BART user, send it a
message that says:

help
send 8bit/-read-.-me-
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This
can be useful for UUCP and other addresses that BART may not be able to figure
out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other
files of interest are 8-bit.cat, containing 1-line descriptions of the files
available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.182.23 or 141.211.165.41),
login as "anonymous", type in your e-mail address as your password, and then
type "cd atari/8bit/New". You may upload files to this directory. Be sure to
set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also,
please upload a short .text file describing your upload so John Dunning can
tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If
you're sending a binary file you must UUEncode the file first. Be sure to
include a short descrption of the file so Jeff Weiner knows what directory to
place it in at the archive. It is especially important to specify that your
upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then
you are welcome to post your file, UUEncoded if binary, directly to
comp.sys.atari.8bit. You'll then be relying on someone else to take your
posting and upload it to the archive for you. Note that long binaries should
only be posted to the discussion group as a last resort.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published
monthly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to

Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/Zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K

format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.

A BBS Express Pro! sysop near here had the idea of hooking up my SX212 through a P:R:Connection (thru the SX's RS232 instead of SIO port). It may work. I'm not the KEENEST on setting up a board, but I thought I'd show it off to all of the IBM losers in my area. (grumble, grumble... I still wanna bring my (newly upgraded, mind you! ;)) 1200xl to school and show off the BigDemo next to all of those 386's just to see what gets more "oohs" and "ahhs" ... hehe.. (they have no sound cards! hAHAHA!)

Speaking of Poland... that's where "Mission Shark" and "Fred" were made.
Now that my 1200xl has an 800xl OS installed, I can run the demos. of
these two games. Excellent games, they are! (Fred is a little slow, esp.
for the upbeat music, but it's still an interesting game.)

Mission Shark is a "infiltrate enemie base" style game

Fred is a strange cave-man version of "Super Mario Bros." theme

Not yet, perhaps when version 5 comes out, and the source code is
available, somebody will patch it to use more than 2 banks, but for
now it is limited to just the two.

4494. Re: MIO/Hard Drive Hookup..?

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-03 05:42:44 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1992Dec3.054244.6086@news.ysu.edu>
Source record: 108737

OK...here's what I did...Let it be known that I could have done
other things in different ways that I'm sure others who have a HD
will say differently but my system works like a charm and I didn't
have to spend too much on it; here goes:
I bought my MIO years ago (1meg) when it cost $289 on sale. When I
bought it I got a disk with it with hd utilities: format porgrams,
park, etc. I did not buy a hd until about a year ago. I picked up
a used Seagate ST238R 30meg hd for $75. It needed an RLL controller
to operate. (I now see the same drive refurbished in Computer Shopper
for $119).
The only place that carried the controller (Adaptec 4070a) was CSS
(Bob Puff and CO.) I think I paid $125 for it and he made me a 5'
cable for it from the MIO to the comtroller. I also needed cables
from the drive to the controller which Bob supplied those also.
He only charged me a few buck for the cables.
You also need a box to put it all in and a power supply for the
hd. ICD don't have it anymore...and I'm glad because what I did next
seemed to be a big benefit then and now....I bought an IBM style
mini tower case w/200watt power supply for $67. When it came,
EVERYTHING I NEEDED WAS THERE! Nuts, bolts, screws, plates, even
an IBM style speaker, switches, cables etc, etc, etc.
Since it was an IBM drive it plugged right in to the controller
and the drive.
This year I sent away to CSS for a dual drive conversion and
now I'm mounting the gutts of my XF551
5 1/4" drive and a 720k Sony 3 1/2" drive in the same case and
powering it from the same power supply. Isn't that nice!

Interesting. The first 520STs sold in the US had 512K, TOS in RAM, and no internal drive. When they added the built-in floppy drive, they changed the name to 520STFM. Maybe Atari planned to make a 256K machine, had a few thousand "260ST" cases made, then decided that 256K really wasn't enough RAM.

Hello,

by the way, TOS need at minimum 512kB RAM, if you load it from disk. TOS is loaded in the upper 256kB and copies itself in the lower 256kB. So with the TOS Atari first realesed to the public, such a computer would be impossible.

Bye, Markus

Express 850 works fine with MyDos,that is what DOS I have my copy on. I happen
to like MyDos,but soon I will be adding Mi_Dos to work with it.Bill K. showed
it to me the other night,and it gives MyDos that SpartaDos look and feel about
it.

Jon,

I think you mean alt.znet.8bit. It's a moot point here though as we don't
get any of the alt.znet newsgroups. That is the problem with alt groups.
I am on a fairly big Bell Labs news server and we get most of the newsgroups
except the 'alt' ones that I would like to get. :-)

I do try to get the latest 8bit zmagazine directly from Ron's BBS. I just
was on the night before last and #210 is still the latest issue. I do
have a mailing list mostly for local (to me) 8bit Atari owners, but I would
be willing to add someone if they can't get it any other way.

One other thing; a question really. Since Ron restarted publishing his own
edition of the ST Znet, he has not had a new issue of Atari Explorer Online.
Is it still being produced? Has Ron decided not to carry it? Where can
I get a regular supply of the new issues?

4507. Digi-Studio hits the US!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-04 12:41:30 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Dec4.124130.10580@aber.ac.uk>
Source record: 108749

The first batch of Digi-Studio has arrived with my US distributor. They are
available for sale now! Show us your support by sending for your copy today!
Digi-Studio Information

Digi-Studio is a set of programs for the 8-bit Atari (XL/XE) for creating
music using "real" sounds, which have been digitized. The Digi-Studio package
contains everything you will need to create and play music using digitized
sounds. Here's a list of the programs included:

* Keyboard Player. Allows you to play music live by using the computer's
keyboard like a piano keyboard. The sounds produced are, of course,
digitized. This program has fully responsive keys, so that sounds only
play for as long as you hold the key down.

* Tune Player. This program plays Digi-Studio tune files using digitized
sounds.

* Sample Editor. This program allows you to edit sound samples by using
a joystick. It also has "cut and paste" facilities, so you can also create
your own samples.

* Tune Compiler. This program allows you to play Digi-Studio tune files
in your own Basic or Turbo-Basic programs.

* LIDS Compiler. This program allows you to create your own Digi-Studio
tune files by use of a language called LIDS.

Also included are 55 sound samples, and 44 ready-to-play Digi-Studio
tune files.

The Digi-Studio system comes on 2 DS/SD disks. Disk one contains the main
programs and a starter pack of sounds and tunes. Disk two contains more
samples and sounds for use with Digi-Studio.

The Digi-Studio system is also supplied with a 44 page manual in A4 size. This
manual has sections describing all the programs listed, but also has a lengthy
section on how to read music. An appendix has also been added containing
music along with the corresponding LIDS programs.

The Digi-Studio system (with manual and 2 disks) costs just 12pounds+1pound
P&P. In the US it will cost $29.95+$1.50 shipping.

Fill in the form below and send it with payment today!

------CUT------
Please send me a copy of the Digi-Studio system, with manual and 2 disks.
I enclose payment for UK[ ]. I enclose payment for US[ ]. (Tick box).

UK cheques/POs payable to Dean Garraghty. US checks/MOs payable to Lance Tatman.

I recently accuired an 800XL. One of my favorite programs MULE will not work on it. I've got the FIX XL program and I use it. Mule loads no problem. You select the level and the number of players, but when you go to select you creature type, you see "stick" written to the screen and then it disappears. It's like someone's pressing the joystick button. I've swapped several sticks in and out of this port with no luck. You can't continue unless you select a creature, but neither port1 or port2 is accepting input. I still have my older 800 so I could use it I suppose. Is there any fix or patch for Mule to make her work on an XL?

>aa700@cleveland.Freenet.Edu (Michael Current) writes:
>
>> Z*Magazine, if another one ever gets published, is mailed out by Ryan
> ^Is available in the news.group
> alt.znet.pc

First off, the original poster wanted to know if they were available by e-mail. This is a viable concern, as many readers of this group do not have Usenet newsgroup access.

Secondly, if you've followed the discussion on comp.sys.atari.st you'd realize that due to a "misunderstanding," alt.znet.pc and alt.znet.fnet basically do not exist. I have two separate accounts that "carry" those groups, but have never carried a single posting in them. I'd be curious to know if anyone outside of New Zealand actually has access to what's supposed to be in the alt.znet groups.

If I hadn't sold all my 8bit stuff, my next step would have been to remount
everything in a PC case. I had a 1meg MIO running off an uninterruptable
power supply (motorcycle battery & trickle charger with a couple diodes to
drop the voltage a bit to the MIO), and a 20meg FH HD, XF551, SX212, and a
320XE. I was thinking about using the TransKey, and uncasing the rest of
the stuff to mount inside the PC case. With the exception of the battery,
I'm sure I could have gotten it all into the case.

From: Jeff_M_Lodoen@cup.portal.com
Message-ID: <70970@cup.portal.com>
Source record: 108606

MULE should have no problems running on an 800XL. It's the only machine I have used it on. Didn't have to use FIX XL either.

Assuming there wasn't more than one version released...

It could be a hardware problem (ie, acting like the button is pressed).

A little BASIC program could tell you, ala...

```
10 PRINT STRIG(0),STRIG(1)
20 GOTO 10
```

STRIG=0 means no button pressed, 1 is pressed.

4512. Atari.Archive restrictions

> Hey, um....anybody know why there is no read permision for the
>files in the New directory?

I do. They did this to prevent anyone from uploading something to the
directory and someone else downloading it before the moderators had a
chance to take a look at it. The way it was before, it was just free
storage space for anyone.

This way, everything sits there unaccessible to us until John Dunning moves
it over to the permanent directories. (In the case of 8bit/New)

>I've tried: XIO 38,#1 (1-7 was tried),64,0,"R:"

The command you're using here is not designed for the printer port. (Note
the reference to the R: device...) You've been talking to the serial port.
I personally don't think you're gonna make this work by doing anything to
the 850. Your options are to set your printer to append the line feed
(check your manaul for the XFEED option, or some other such nomenclature)
or plan on using some software-based utility to make the conversion.
Personally, I use Text Wizard to search/replace CR/LF combos with ATASCII CR
character (or vice versa) If you own an ST, there's a GREAT utility called
DCOPY that will do this for you VERY FAST. But be careful about version #
of DCOPY, as this feature was removed from later versions. (I use v3.14)

Good Luck!

Contact me at: worley@a.cs.okstate.edu
if you are interested in the following:

All software/books for Atari 8-bit computers.
The software is in original boxes and includes manuals.

The price is $50 for all plus S/H.

Software:

Title	Media	Comments
War	1 disk	
Tanktics	1 tape	Includes boardgame
Success with Math	1 disk	
CocoNotes	1 cartridge	
Microsoft Basic	2 disks	w/utility disk
Witness (by InfoCom)	1 disk	Good game
The Bookeeper	6 disks	
Millionaire	4 disks	Good game
Code Writer	1 disk	plain-eng prog design
Bond Analysis	1 disk	
Stock Analysis	1 disk	
MicroPainter	1 disk	The infamous

Books:
Stimulating Simulations
Compute!'s 2nd book of Atari
Atari Sound and Graphics
Machine language for beginners
Atari Basic
820 Printer Manual
Inside Atari Basic
Basic Computer Prog. for the Home
Your Atari Computer (the BEST book on Atari, in my opinion)
Programming Your Atari
Atari Basic
Atari Games and Recreation

Will not separate. Make offer for trade for IBM software/hardware.

E-mail all inquiries to : worley@a.cs.okstate.edu

4516. AR HISTORY

Newsgroup: comp.sys.atari.8bit

Well, I am sure that Mr. Price might be tired of AR by now..
however..I had always wondered exactly what happend at DataSoft in order
to classify AR-The Dungeon "lost." Also, since he worked with the design
teams for the "released versions" of AR for other computer systems...was
the released Dungeon similiar to what you had originally started?

Mr. Price?? =)

4517. ATARI<=>IBM DISK FORMATS

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-05 20:00:29 UTC
From: Karll the Ghoul <AKH104@psuvm.psu.edu>
Message-ID: <92340.150029AKH104@psuvm.psu.edu>
Source record: 108613

Since there has been so much interest in reading Atari Disks on the
MSDOS compatible machines...I summit this BRIEF notice...

There are 3 currently available Atari disk readers:

1) sr.arc (29360 bytes)
2) util.arc (27487 bytes)
3) atario21.arc (20992 bytes)

all three are available from the archive via ftp access at

atari.archive.umich.edu under the directory: atari\8bit\Diskutils.

ALL DISKS MUST BE IN DOUBLE DENSITY!

sr.arc is a sparta dos format disk reader. This is the only
spartados disk reader known.

atario21.arc is a mydos format disk reader that supports sector
viewing and XFF551 support for double sided disks.

util.exe is the only program that will READ AND WRITE mydos disks.
It also has parameters for other drive types that I have yet to exactly
have function correctly.

If I am going from MSDOS to MyDos I use (must use) UTIL.
Going back I use ATARIO since it is so simple to use and fast!
However, I am starting to use SR and like the results.

Hope this helps...

Andrew

4518. Re: ATARI<=>IBM DISK FORMATS

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-05 20:26:39 UTC
From: Karll the Ghoul <AKH104@psuvm.psu.edu>
Message-ID: <92340.152639AKH104@psuvm.psu.edu>
Source record: 108614

OH..heh..one more thing...IT IS WISE TO FORMAT the disks you will be
using to swap files with on the MSDOS machine you plan to use. This is
because the disk controllers on the ibm are slightly more "tight" than
the ones on the atari. I have never had a problem formating disks with
util on the msdos machine and then reading and writing with the atari drive.
However...I have had several problems (1050 in particular) when formating
the disk on the atari drive first. The msdos machine usually 'craps out'
and gets scrambled sectors.

If you need anyhelp using any of these programs, please don't hesitate
to ask me! =)

4519. Re: 850 Interface

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-05 21:00:35 UTC
From: Karll the Ghoul <AKH104@psuvm.psu.edu>
Message-ID: <92340.160035AKH104@psuvm.psu.edu>
Source record: 108612

umm I might be missing something here but page 27 of the 850 tech manual
says :

"The (optional) sending of LF after CR is produced in the translation
step. If you specify no translation [doesnt this work for graphics?], the
option of adding LF to CR is not available. If you specify Light translation
LF will folow EOL (which of course becomes CR). Note that if you send the
13-decimal code (CR), LF will be added to it (when Append LF feature is on).
Each character in the CR/LF pair is independently sent through the parity and
and word shortening steps on the way ou. The preset default setting of the
Append LF feature is OFF, that is, the default is to NOT append the LF.
LF will be appened only if translation is enable. If NO TRANSLATION is set
LF will not be automatically appended to anything."

also....page 83 Appendix B.

XIO 38,#IOCB, AUX1, AUX2, "Rn:" <=====wonder about P:??????

AUX1 option:
Translation:
0 Light Atascii/ascii Translation
16 Heavy
32 NONE

Input Parity:
0 Ignore/no change
4 Check for odd parity, clear parity bit
8 Check for even parity, clear parity bit
12 Do not check parity but clear parity bit.

Output Parity:
0 Do not change parity bit
1 Set output parity odd
2 Set output parity even
3 Set parity bit to 1

LF OPTIONS:
0 Do not append LF
64 Append LF after CR (TRANSLATED from EOL) <==means light or heavy

Add your bits up and off you go...

HOWEVER!!!!! page 69 says.. the printer interface module "translates
EOL into ASCII CR. No other translations are made. In particular, bit 7
(high bit) of each byte is not changed, and LF is not added following CR.
However, multiple EOL's in a row, without intervening characters, are sent
to the printer as alternating CR's and blanks."

and looking over this I notice that perhaps you CANT change LF options
on the P: device. hmmm.....ah..just use the converter file that comes with
Turbo Basic to convert text to real ascii for you. =)

Speaking of Mission Shark and Fred...I must addmit that these little gems are great games! Fantastic Graphics and IMPOSSIBLE to copy on the Atari. Just out of curiosity I tried to make a copy with my Duplicator (Yes, I love it so there!) and it told me the disk was blank! So out come Anadisk for the msdos machines. My oh my! what protection on that disk! various densities missing tracks...128bytes of data in upper half of 256 byte ones tracks gone...sector numbers of 256! and Anadisk couldnt read the entire disk either...it says half of it is blank!

Someone sat down and found a way to thwart piracy...where on where were you guys 6 years ago? =)

Source record: 108616

Just a little thing I would like to share with everyone here...

There is a nice complex Computer Science Course here at Penn-State
for designing educational software for Xwindows and other systems...
as well as other neato stuff for use in the real world at other univerisities.
and well...heh...as odd things go...part of the course is learning to
design user manuals. The instructor went through hundreds of Atari 2600
manuals learning how they did it since he always thought they were so simple!

It became the outline for the class...and as such..the manuals for the
programs they developed are very nice and easy to understand and have
turned some heads! Those who thought it was the dumbest thing one could
do are very impressed that the format works. =)

Andrew
PS: We have this AMIGA graphics design lab here....hmm...I wonder if
Atari wouldnt consider approaching PSU with a FALCON lab. =)

Is MULE a 1-4 (or 2-4) player game? If so, it may be accessing the PortB registers, which are now (1200xl & up) not used for controllers. An example, I typed in that old Keyboard controller demo from the Atari BASIC reference manual and it always crashed. Then I figured it out. It's trying to look at all 4 ports that the 400/800's had, so I simply deleted the code that looked at the 3rd and 4th port. Of course, unless you know how to hack into MULE (assuming it DOES have 4-player capability), this "fix" is useless, but I'm sure SOMEONE out there in Net-land knows that to do!
:)

Kit,

It is alt.znet.pc .pc being the personal computer magazine section. As
all computers are personal they all go in this news group.

I take your point on the alt.groups though, and it is one I am sure is
not going to be resolved very quickly.

AEO is still being produced along with all the Z*NET Magazines.

Source record: 108624

How does "The BBS Express!" send the modem initialization command string to the SX212 ? Is the modem initialization string declared in a "setup" file somewhere ? Or is the modem intialization string hard coded into the main program ? You could just send the AT "attention" command that resets your modem to the higher baud rate as part of the modem initialization procedure. The difficult part is in figuring out what "The BBS Express!" uses as its modem initialization procedure. I have set up OASIS JUNIOR III successfully, but I have never set up "The BBS Express!", and as yet do not own the SX212 modem, so -- unfortunately -- I am unable to provide you with a specific solution to your problem. I would like to wish you luck, however!

I always did like the 2600 manuals. Whenever I thought of writing a manual for a game, I'd first go to my old 2600 game booklets. Great stuff they made.

My friend's mom used to translate them into German for Atari, too... (maybe not ATARI, tho.. not sure what company...)

> Gigablast - best guess: breakout style game...
or space shoot'em up

Do they have Mission Shark? What about Dredis, Sogon, Drag, and
Cultivation? The 1st is a K.O.Distributed game, along w/ Fred. The
others are along with Zebu-Land on the KE-Soft demo disk..

Cool, though. What's the date of the oldest game? (my best guess is
Zybex (if that was it) 87? or 88. And/or Draconus, 88.

What about the date of the NEWEST game!?

And where's that Rubber-ball (?) game supposedly written in Quick??

hmm

From: bbs@neb
Message-ID: <1992Dec7.034102.131@neb>
Source record: 108633

BBS Express loads the main program back up after someone logs off. If you flip through that main prog., you will eventually find the modem initialization strings.

BBS Express Pro! uses separate modules, and waitcall.cmd would be the one with the initialization string in it..

4539. Re: MULE won't work on my XL.

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-07 06:42:34 UTC
From: thester@nyx.cs.du.edu
Message-ID: <1992Dec7.064234.11573@mnemosyne.cs.du.edu>
Source record: 108635

If you have to hack MULE to make it work on the XL because of
the non-existant 3rd and 4th ports, get a good disassembler
/disk editor and insert a NOP ($EA) wherever it goes to
a routine that does something to STICK2 and STICK3. (Remember,
the first is STICK0.) These would be $27A and $27B.
The only problem I can foresee is that your disk is copyprotected
and you won't be able to 'see' the code.
If it's not copyprotected, make sure you only work on a
backup copy.
If you are curious, NOP means No Operation.
This is probably not as simple as it sounds. There are probably
other subroutines that depend on output results from those
'non-existant' ports. If they don't get what they want, the
program will probably still crash.
But I'd say it's worth a try. Nothing ventured, nothing gained.

****

A T A R I C L A S S I C S

LETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BU

****

[Jeff, please forward to the Digest, all my posts to CSA8 for the past 4 weeks have bounced, the sysadmins here say the problem is at Berkeley & the Postmaster
there has not replied to my request for assistance.]

The mass mailout of AC's Premier Issue during the last week of October/ first week of November has moved somewhat slower than anticipated. Here we are one month after the mass mailing, & I'm still getting reports from people who JUST NOW received the magazine. That's rather sobering.

It's also creating a huge logistical problem. Apparently a lot of folks received AC just before Thanksgiving, which was real convenient. Now the paid subscriptions are flooding in here like 50-60/week. In the meantime, new requests for the Premier Issue are still coming in at a fair pace, plus we are also receiving a lot of postal & email (total 120/week). Add to that, production on Issue #2 began this past weekend (December 5 was our copy deadline for the February 1993 issue). And production of our first disk is scheduled to commence later this month. I'm a resourceful fellow, but I'm not superman. Something has to go.

Therefore, free distribution of the Premier Issue will cease after:

D E C E M B E R 1 5, 1 9 9 2

which is a week or two earlier than I had planned on. All distributions (free or otherwise) will cease between December 15, 1992 and January 30, 1993 while the Staff is occupied with issue #2 & the first AC Disk.

Inquiries received during that period will be delayed until February.
At that time delayed inquiries will be sent only a subscription form as a response.

Remaining copies of the Premier Issue (if any) will be listed in issue #2 as Back Order Sales (price to be announced).

A few statistics:

Total copies of AC distributed to date: ca. 1500
Copies distributed at the WAACE Fest : ca. 280
Copies distributed in the mass mailing: ca. 770

Copies I've mailed out myself : ca. 450

Copies returned for bad addresses : ca. 15 (1% of total)

Total paid subscriptions so far : ca. 200
% of paid subscribers taking the disk : ca. 70%

Source record: 108641

I have run up against a dead end on this 850 problem. Has ANYONE ever
successfully used the 850 parallel port without modifying their printer
or loading up some sort of P: handler first???

I've tried multiple 850 interfaces, so its not a hardware problem. My
printer with its current dip switch settings prints out just fine with
my Supra printer interface & MIO, but when I try to print to it via the
Parallel port on the 850, I get no CR/LF combo. How disgruntling!

Micheael: I've mailed to you many times, not sure if all those mail attempts bounced, but let me post this to you here:

I've tried calling your FREENET system via the BBS phone number multiple times (at 9600bps). I get a CONNECT 9600, then your system kicks into some kind of HOST mode or something - but doesnt allow me to logon or even provide any kind of logon prompt. After about 45seconds, it hangs up. Is there any other way for me to investigate your system?

I only have mail access on this BBS system (into the Internet), so I am unable to FTP. Can I access the Freenet via mail using SEND, etc..?? If so, let me know.

Jeff posts on Ben's behalf that the free issue of AC won't be available after 15-DEC. Aargh -- I haven't received mine yet! Ben, if you're reading this, I have been hoping to hear from you after recently telling Jeff that the problem MIGHT be that I MOVED in May 1992, and don't know whether I gave you guys the NEW address or the OLD one. I gave Jeff the new one and asked him to look in the AC mailing database to see which address you guys had, but he responded that his disk was down and that he was forwarding the issue to YOU. I haven't heard anything, and don't know if it's due to problems on your end, at Berkeley, or where; I'm raring to read and subscribe to AC (I will get to see a friend's copy at Christmas if not before, but I WANT MY OWN COPY, DAMMIT), but won't do the latter until I do the former at least once! Please contact me by any of the following mechanisms:

e-mail: Chris_F_Chiesa@cup.portal.com , xetwnk@shell.portal.com
phone: (716) 482-9573 after 5PM M-F, anytime weekends; Eastern Time
snailmail: 223 Harwick Road / Rochester, NY 14609

(That latter is ALSO the address to which my premier issue of AC _should_ be sent, if it wasn't already. If it was, well, the damn thing STILL hasn't gotten here and somebody needs to know about that.)

Thanks in advance,

Chris Chiesa
Chris_F_Chiesa@cup.portal.com

Mule has worked fine on my 800XL system. I don't think that the software problem has to do with the fact that the XL's have only 2 ports, as the program would be reading from the ports, not writing to them. Writing to the portB register is how the banked memory is switched, and I don't think that the game would have any reason to write to that memory address.

Hmm, well David Richardson, the DD3 guru, is now a columnist for Atari Classics magazine, so perhaps by contacting him c/o Atari Classics will provide some answers. I'd like to help you, but didn't keep a copy of GR8todd3 when I sold my DD3 package. Even if I did, it would be on 720K disk, and that is down right now.

From: jjmcwill@next3
Message-ID: <1992Dec7.222419.954@mtu.edu>
Source record: 108649

The message was passed along to Ben approximately 24 hours after
I received it.

Ben is having a horrible time trying to get mail through to several places,
including Compuserve, C.S.A.8. and elsewhere, because the people where Ben
works recently upgrade the operating system on their mainframe.

I'm dismayed at the number of people who still haven't received the
first issue, it was mailed out quite a long time ago. Third class
must be horrid in some states.

Ben has been continually mailing out magazines... perhaps he's mailed you
a new one but just hasn't responded to you yet. Considering that even
getting to me the magazine took several weeks, and I was one of the first
to receive it, it may be another week, maybe two before you see it.

Ben is currently busy up to his ears with the magazine, acting as Managing
editor, circulation editor, liason between the Atari Classics staff and
Unicorn Publishing; all in addition to holding a demanding, full time
job. He's also gotta feed and clothe himself. I assure you, if there is
a problem with mailing, it wasn't deliberate, and Ben's doing everything
he can to try to make everybody happy.

Hello Every Body

I really want a copy of Dandy, Mule and Zambies. I will pay you $30.00
for all 3 or 10.00 each. I do not need any manuals or boxes. If you want more
I will need manuals and boxes. I will need these games on disk. I will even
supply the disk if you need them.

Raul

P.S. Can somebody please name all the disk drive that came out for the
atari 8bit computer?

4560. HHG solution

Here it is:

GameSig Archives Page GSA-1752

The Hitchhiker's Guide to The Galaxy

Ok everyone, hang on to your seats (and your towels!); this is probably going to be the wildest adventure game you'll ever play...unless Infocom comes out with a sequel, which they just might do!

Before we get started, a few words of advice. This is not the only way of getting through the game. Many of the problems and situations (such as the whale's belly) have more than one solution. So, you might want to save the game from time to time, and experiment a little, to see if you can find other ways of doing things (actually, it's wise to save the game anyway, in case you make a mistake).

Also, consult the Guide frequently during play; you will gain some useful insights to some of the objects you come across, and even some helpful information (sometimes). And remember, no matter how bad things may look: DON'T PANIC!

Here you are, mild-mannered Arthur Dent, about to start the worst day of your life, although you don't know that...yet! Actually, the day is already getting off to a bad start, since you've just woken up in the dark, with a really bad headache (and it's all downhill from here).

The first thing you need to do is stand up and turn on the light. That's a little better, anyway! Or maybe not, since you're having a hard time getting coordinated. Grab the dressing gown and put it on, then look in the pocket. Ah, an analgesic! Take that, then get the screwdriver and the toothbrush, and head South to the porch (did you hear a tree fall? Rather omnious, isn't it?).

Here you find something no modern home should be without: junk mail. Take the mail, and go on outside. Uh-oh! There's a very big bulldozer on its way to level your home, and there's Prosser standing by, watching it all. Are you going to take this lying down?

You bet you are! That's the only way to stop it: lie down in front of the bulldozer. No matter how close the thing gets, don't panic; it won't run you over (of course, in a short time, it really won't matter what happens to the house, but you don't know that yet). Just wait awhile until Ford Prefect shows up (read the junk mail while you wait).

Ford seems a trifle preoccupied with the sky, but he is aware enough of you to try and give you back your towel. Don't take it, or he'll leave and you will be a lot worse off than you ever imagined (can things be worse than this? They

sure can!).

Instead of taking the towel, ask Ford about your home. He will eventually come to his senses, and realize what is going on. When that happens, he will be able to persuade Prosser to take your place in front of the bulldozer while the two of you head off to the pub to hoist a few.

As soon as Prosser takes your place, go South and West to the pub. Buy a cheese (?) sandwich while you wait for him to arrive (when you read the description, you'll understand about the "?"). When Ford gets there, he'll buy you a few beers. Drink only three of them.

Around about the time you've finished the third one, there will be a loud crash. In fact, it's the sound of your home being demolished by the bulldozer (that will teach you to trust anyone who wears a digital watch!). Don't take that sitting down, leave the pub and return to where your house used to be. Along the way, you'll see a starving dog.

While you may wonder if anything could eat that sandwich and survive, give it to the dog, who will (amazingly!) enjoy it immensely, ignoring a microscopic space fleet that whizzes past (remember that fleet). Then continue on to the ruins of your home (Ford will be right behind you).

And just about now, to put a perfect ending to a perfect day (which has just barely begun), the Vogon construction ships appear, to demolish the Earth to make way for a new Hyper-space Bypass (hmmm, maybe Ford wasn't kidding when he said he was from another planet, or that Earth would be destroyed in a short time).

Still, don't panic...wait until Ford drops the Sub-etha signalling device. There won't be much time after that, so pick up the device, push the green button (if you dropped the Aunt's thing, have no fear: it will turn up again later), and you will be in....the dark.

Get used to that, you'll be spending a lot of time there before this adventure is over. Notice that, at first, you can't do much. All your five senses seem to be out of order. However, if you wait, and read the descriptions very carefully, you will see that eventually, it mentions only 4 of your senses. The one that's missing is the one you can use. Keep this in mind, it will come in handy later.

Right now, your nose seems to be working again, so smell. Sniff, sniff. Ugh! Whatever it is, it sure is strong! You are also now dimly aware of a shadow, so look at it. Well, well, it turns out to be Ford Prefect! And, looking around, you find yourself in the hold of a Vogon ship. Certainly better than being on Earth (or where Earth used to be).

There's a glass case with an Atomic Vector Plotter inside, but don't bother with it yet. You have something else to do first, namely, obtain a Babel Fish. That shouldn't be hard, right? All you need to do is push the button on the dispensing machine, and you'll have one, right? Heheheheheehe!

Those Babel Fish are pretty slippery characters (but, you may have found that out already for yourself!). And the cleaning robots are certainly no help; they seem to have only one mission in life: grabbing your Fish away from you. Well, we really can't let that happen!

So, first thing to do is remove your gown and hang it on the hook. Now, wait for Ford to curl up, then get the towel and the satchel. Put the towel over the drain, and the satchel in front of the robot panel. Now comes the part that drives most people crazy: they don't know how to stop the upper-half-of-the-room cleaning robot. But, it's so simple: just put the junk mail on top of the satchel.

Now you can push the button! Then step back and watch the Rube Goldberg shenanigans, which end with the Babel Fish stuck solidly in your ear (squish!). Bet you never thought outer space would be like this! However, now that you have the Fish, you'll be able to understand anyone who talks to you.

By the way, somewhere along the line, you will get a message that one of the phrases you've used was instrumental in starting a war that wiped out most of a small galaxy. There is nothing you can do about this; no matter how you try, it will come to pass.

Rather unfortunate, isn't it? Even more unfortunate, sooner or later, the survivors will figure out how that happened, and they will be looking for revenge....but more about that charming prospect later.

Right now, press the switch on the case. This will tell you what the code word is that will open the case so you can snatch the plotter. Make careful note of what word is required; it is chosen randomly each time. Too bad you have to listen to some pretty rotten poetry to get the word.

Speaking of poetry, in a short while, you and Ford will be hustled into the Captain's quarters, and strapped into Poetry Appreciation Chairs (worser things could happen, but right now, you probably can't think of any). After the Vogon Captain has tortured you with the first verse, grit your teeth and enjoy the poetry. He will then, to your dismay, read you the next verse.

While you could easily live without hearing it, in this case, you do need to listen so you know the word to type in. Fortunately, after the second verse, you don't have to enjoy the poetry. Unfortunately, since you survived both verses, the Captain is going to have you and Ford shoved out the airlock (you have now found something worse than appreciating Vogon poetry).

While Ford tries to talk the guard out of spacing the two of you, type in the word from the poem. You must put quotes around the word, or it won't go through. Then get the plotter when the case opens. Now just wait awhile, and you and Ford will soon be in the airlock, with very little time left.

In fact, time has just run out, and there you are in the depths of space. Lucky for you, the Guide explained how to survive all of 30 seconds out there! Well, perhaps not so lucky, since, considering the vastness of space, it's quite improbable that another ship will come by to pick you up before the 30 seconds run out. So naturally, 29 seconds later, the Heart of Gold (the HOG) comes past and picks you up.

There you are in the dark again. Wait and watch the display, until it no longer says you can't hear. Then listen, and you will hear the sound of the star drive. Now it gets cute: the program will lie to you, and say there is an exit to port. Don't you believe it! Go Aft instead, and you will be in Entry Bay 2. You can ignore the brochure, if you like.

Go Aft again, and you're in the Fore End of the corridor. Here, Ford will find you you, and take you up to the bridge, where you meet Zaphod and Trillian. Actually, you've seen them both before, at a party you attended a short time ago. While you listen to the chatter between Zaphod and Ford, you can begin to drop some items here.

You can drop the plotter, screwdriver, gown, and signalling device. By this time, everyone else has gone to the sauna, leaving you alone on the Bridge with Eddie, the shipboard computer. Don't mind Eddie, he's a little over-protective, but he's a good sort at heart. In fact, you can pretty much ignore him, as well as Marvin the Paranoid Robot, although Marvin will be important much later on (depressing as that may sound).

Ok, time to prepare for some pretty weird happenings! First you'll need the spare improbability drive. So, go down, then Aft. Keep going Aft. The program will tell you that the Engine Room is dangerous. It LIES! Don't listen to it, just keep going Aft. Eventually, you'll get there.

Of course, as soon as you're there, you'll want to look around. The program will tell you there is nothing to see. That, too, is a lie! Keep looking, and you'll find that there are some things to see here, especially the spare drive. Don't worry about the tools for now; you can leave them where they are.

Once you have the drive, go back to the Fore End corridor, then head Port where you'll find the Nutrimat (try consulting the Guide about the Nutrimat). Touch the pad, and you will be provided with a delicious (?) cup of advanced tea substitute. Fortunately, you don't have to drink it. Take the cup (ignore the carton, it's useless) and return to the bridge.

Drop the cup and the drive. Now, plug the small plug in to the small receptacle, and put the plotter's dangly bit into the tea substitute. Ok, you are about to have some pretty strange experiences, but before you throw the switch, some words of advice and caution.

There are five scenarios (all rather short, but all of them important), that have to be completed. They come up in random order, so each one has its own little section of the walkthru. The lead-in to each of them is that familiar dark area, where you have to wait until one of your senses is working again. You will be in the dark area again when the scenario ends (and you will have to listen for the drive sound), which will then bring you back to the HOG.

Also, be aware there are times that you may briefly go back to one of the scenarios you have already completed. You just sort of bounce in and out of those, but you do have to spend time waiting in the dark. I couldn't find a way around this, so you'll just have to live with it. Finally, it's a good idea to save the game after you complete each scenario, just in case. With that said, it's time, so push the switch!

The Bugblatter Beast

When you come out of the dark,
you find yourself in the Lair of
the dreaded Bugblatter Beast.
There are, perhaps, better
places you could wish yourself
to be in, considering that,
among its many charms, the
Bugblatter has those tungsten-carbide vast-pain claws (perhaps he was a dentist in a previous life).

However, you are here for a purpose, so you'll just have to do something about the Beast. Consulting the Guide tells you that Bugblatters are incredibly stupid, which is certainly the case. In the meantime, the Beast is bearing down on you, demanding your name. Don't be shy, introduce yourself, then run like heck East out of the Lair.

Pick up one of the sharp stones, and then cover your head with the towel. Old Buggy is so dumb, he thinks that, since you can't see him, he can't see you. But, this won't last for very long, so you have to fool him, and quickly. Lucky for you, this isn't hard.

Carve your name on the Bugblatter's memorial. When he sees the name there, he will think he's already eaten you, which is why he can't see you (dumb may be an understatement here). The Beast will then curl up for a nap, leaving you free (after removing the towel!) to re-enter the Lair and then go SouthWest.

Here you will find the skeleton of some poor soul clutching a Nutrimat Computer Interface Card. Take the card, and just wait around for awhile. You will be mistakenly captured as a Bugblatter Beast (talk about insults!), but you will eventually be freed, and have some other adventures along the way, before you find yourself back in the dark again.

When you get back to the HOG, you can drop the asteroid paint chipper and the interface card in the Fore End before going up to the Bridge (you'll need the interface later, but there's no need to drag it around with you now). Once on the Bridge, push the switch again, and you'll be back in the dark.

Trillian

The dark ends with something liquidy to the touch. In fact, you find your fingers bathing in a glass of wine. Coming to your senses, you realize that you are now Trillian, and you are at the party where you (she?) met both Arthur and a mysterious man named Phil.

Take a good look at Arthur, and you will see he has a huge ball of fluff on his jacket. Just what you want, but your hands are full. Drop the plate you're holding, and get the fluff. Open your handbag and put the fluff in it, then get the plate again (otherwise, the pushy hostess won't leave you alone).

Now, all you need to do is wait, trying not to be bored to tears by Arthur's feeble attempts at conversation. Give Phil a look, and shortly he will come over, and take you out to his scooter. As you blast off, everything once again

becomes.....dark.

Ford

Now you find yourself standing in a country lane, holding a satchel. The place looks familiar. In fact, it's the lane outside Arthur's home, and this time you seem to be Ford Prefect.

Those Vogons will be arriving soon, so there's not much time. Open the satchel, and take the satchel fluff, the towel, and the sub-etha signalling device. Go North, and there you will see Arthur lying in front of the bulldozer.

With a certain feeling of deja vu, you offer him the towel. However, instead of taking it, he asks you about his home. You suddenly realize what is going on (not that it really matters, considering what will shortly happen!). In a moment of magnanimity (or possibly madness), you decide to take Arthur hitchhiking with you.

But first, you have to deal with Prosser. Go over to him, and ask him to lie down in front of the bulldozer. He'll make a little fuss, but you'll manage to persuade him. Now, you and Arthur can hurry over to the pub, and drink some beer (remember to buy peanuts).

Sit there, drinking your beer (no more than three!), meditating on why Arthur is taking the imminent demise of the world so calmly, until the house falls and Arthur goes tearing out.

Follow him to the ruins of his home. Drop the satchel, and put the satchel fluff on top of it. Now wait. The Vogon ships will appear, the winds will pick up, and you'll start fumbling with the device.

Oops! You just dropped it! Fortunately, it rolls over by Arthur, who picks it up and looks at it. Also fortunately, Arthur manages to push the right button, and everything becomes....dark.

Zaphod

You come out of the dark to find that you're now Zaphod Beeblebrox, the Presi dent of the Universe. In fact, you're on your way to steal the Heart of Gold (with a little help from Trillian).

As your speedboat zooms towards its destination, search the seat carefully and you will find seat fluff and a key. The key opens the toolbox, but you don't need to do that now. Just make sure you take the box; you might be needing it later.

Now, if you continue on your present course, you'll never make it between the cliffs and the spire (or maybe you know that already). The trick is to make the auto-pilot do the hard work, so steer the boat towards the rocky spire.

The spire gets closer...closer....closer....and then, at last! the auotpilot wakes up, just in time, and steers you to safety! Whew, that was a close one. Ok, now you can stand up and go North to the Dais, where the dedication

ceremonies will be held.

Wait around, enjoying the cheers of the crowd (read the banner if you like), until Trillian appears. She will jump out of the crowd, and hold a gun to one of your heads. The guards are a little hesitant about what to do, so now's your chance: tell them not to shoot.

After a few moments, they will drop their rifles into a pile..just what you've been waiting for. Tell Trillian to shoot the rifles. As the weapons disappear, you and Trillian make a break for the HOG! You made it!! But...everything seems to be getting....dark.

The War Room

Ah ha, fooled ya! I bet when you heard the sound of the star drive, you thought you were back on the HOG. But, surprise! you're in the War Room of a mighty war fleet approaching Earth (at least you're yourself this time!).

Hmmmm, looking around, you see an ultra-plasmic awl. Pick that up, since it might come in handy later. Now, take a good look at the aliens. They are Vl'hurg and G'guvunt. Sound familiar? Ring any bells? Remember that small galaxy you pretty much wiped out with your careless words?

Well, they finally figured out what happened, and now they are on their way to Earth to take revenge! (Uh oh) You can't really stop them, so just wait around and hope for the best.

The fleet gets closer and closer, and then arrives. Amazingly, the first thing they see is....a huge dog happily munching a cheese (?) sandwich! The sight of this giant monster, contentedly eating, softens the hearts of the Vl'hurgs and G'guvunts.

With a new mission in life, they turn around and go home. Along the way, they transport you back to the HOG. Unfortunately, since the aliens are microscopic, so are you.....and you end up materializing inside your own head!

But wait....maybe there is a madness in this method, after all (or is that the other way around?). Move along the mazy of synapses (any direction will do, they're all alike), until you come to the particle.

Look at the particle, and you will see it's your common sense. If there's one thing you surely don't need in THIS adventure, it's common sense, so take the particle. Whoops! Everythig just went.....dark.

Ok, now you should have collected the four fluffs, the ultra-plasmic awl, the paint chipper, the nutrimat computer interface, and the tool box. After you have done the last scenario (whichever one that is), don't go back to the Bridge. Pick up the interface, and go to the Nutrimat. It's tea time!

Open the panel on the Nutrimat, remove the circuit board, and replace it with the interface. Now, touch the pad. With a clearer idea of just what it is you want, the Nutrimat begins to have some problems. Its own limited circuitry can't handle it (well, it's just a dumb machine, after all), so it ties into the main shipboard computer.

Don't spend time here watching the Nutrimat go through its gyrations. Head for the bridge, and plug the large plug into the large receptacle. The moment is almost here: the HOG has arrived at the legendary lost planet of Magrathea, and the natives aren't friendly.

In fact, they are sending up a bunch of missiles to vaporize the HOG (hmmm, they really AREN'T friendly!). Now, push the switch on the spare drive. Wow! Talk about improbabilities! The missiles have turned into a giant sperm whale!

After accepting the congratulations of Ford, Zaphod, and Trillian (who conveniently disappear into the sauna again), return to the Nutrimat, where you will find, at last, a cup of REAL tea. Get the cup (you will drop the No Tea), but don't drink it!! Bring it to the Bridge.

Drop the real tea (you will automatically pick up the No Tea). Remove the dangly bit from the tea substitute, and put it in the real tea. You have one more little trip to make. First, however, drop everything you are carrying except the Babel Fish and the Aunt's Thing (yes, you have it again, you just can't get rid of it).

Push the switch on the Drive. After a short stay in the dark, you will find yourself in the whale's tummy (it may, however, take more than try to get here, but you will make it eventually). There's a flowerpot here! Get the pot, and put it in the Aunt's Thing. Now, wait around (you really don't have a choice), and soon you will be in the dark again.

Ah, back on the HOG at last. If you take inventory, you'll notice you don't have the Aunt's Thing. Don't panic! It will, as always, turn up. In the meantime, go around picking up the various fluffs. The Zaphod fluff, along with the tool box, will be by the hatch. Trillian's, of course, is in her handbag, and Ford's is on the satchel, and the last one is in the pocket of your gown (unless you took it out earlier and dropped it somewhere).

The Aunt's Thing has reappeared by now, so go up to the Bridge. Take the flowerpot, plant all four fluffs, drop the pot, and wait awhile. When you see a tiny sprout has formed, take the pot into the sauna. When you emerge, a changed man, you will also have a changed plant.

However, there is another problem! The HOG has landed on Magrathea, but Eddie, overprotective as usual, has jammed the hatch shut. And, he's not going to open it, no matter how long it takes him to check for dangers on the planet (which will be quite a few years).

You are almost ready! First, eat the fruit from the plant (mmm, tasty!). You have a vision, and pay close attention to it: the vision shows you what tool Marvin will need to open the hatch. This varies from game to game, and there is no way to know which one it is until you eat the fruit. That is also why you have to collect all those tools. Get the tool that you saw in the vision. If it happens to be one you haven't seen yet, then you'll find it in Marvin's pantry.

The trick now is to find Marvin, and he's in his pantry, behind the screening door. First, get the real tea. You automatically drop the No Tea. But, you don't have your common sense anymore, so....pick up the No Tea! Now, you have both Tea and No Tea at the same time!!

Go to the Screening Door. Open it. The Door, impressed by your being able to have both Tea and No Tea will let you through! However, WAIT!!! Don't go through the door yet! If you set foot in the pantry, you will be overwhelmed by depression! So, that magic moment has arrived, the moment you've been waiting for ever since you left Earth: drink the real tea!! (Ahhhhhh, good to the last drop!)

All right! Now you can go into the Pantry (yay)! Marvin will be there, sulking as usual. Tell him to fix the hatch. Marvin will grumble, but he will agree to it, and tell you to meet him at the Hatch Access Space, with the proper tool, in twelve moves.

As you already have the tool (thanks to the fruit), you can go directly to the Access space (drop everything but the tool and the Fish), and wait for Marvin. When he arrives and asks for the tool, give it to him. Marvin will fiddle briefly, and the hatch will slide open.

Go out to the Hatch, and then down the Hatch. Wow! You have now set foot on the legendary lost planet of Magrathea, and.....

And what comes next, will have to wait for the sequel (and let's hope it isn't too long a wait!!!)!

In a previous article, bbs@neb (BBS System 801-572-4969) says:

>Micheael: I've mailed to you many times, not sure if all those mail
>attempts bounced, but let me post this to you here:

I have not received any mail from you about Free-Net access..

>I've tried calling your FREENET system via the BBS phone number multiple
>times (at 9600bps). I get a CONNECT 9600, then your system kicks into
>some kind of HOST mode or something - but doesnt allow me to logon or
>even provide any kind of logon prompt. After about 45seconds, it hangs
>up. Is there any other way for me to investigate your system?

I have two ideas. One, try reverting to something slower, like 2400 bps.
I'm not sure the Free-Net modems go any faster than that. Secondly, I know
they were having trouble with the dial-in lines recently, and the problem
they described sounded similar to what you describe, so you may simply need
to try again.

>I only have mail access on this BBS system (into the Internet), so I am
>unable to FTP. Can I access the Freenet via mail using SEND, etc..?? If
>so, let me know.

The Cleveland Free-Net is accessible over the Internet by TELNET, which is
not FTP and is not mail. It doesn't sound like you have TELNET access.

Message-ID: <Dec.8.10.28.57.1992.17504@electron.rutgers.edu>
Source record: 108660

It's been awhile since I last posted this, so here it is again.
If anyone has any corrections, additions or other comments, please leave me some email. I'm especially interested in Activision serial numbers.

I'm also interested in creating a list of all disk based games that have been published for the Atari computers. I already have a list of several hundred titles, but I am looking for volunteers to help in filling it in some more. Leave me email and I'll mail you the current list.

Current number of carts: 318

Manufacturer	Serial no	Year	Title
Activision	CZ-002-04	1983	Kaboom!
Activision	CZ-003-04		Mega Mania
Activision	CA-012-04		Space Shuttle
Activision			Beamrider
Activision			Decathalon
Activision			H.E.R.O.
Activision			Pitfall
Activision			River Raid
Activision			Zone Ranger
Activision		1984	Keystone Kapers
Activision		1984	Pitfall II
Activision		1984	Zenji (a maze type game)
Activision			Designer's Pencil, The
Activision			Dreadnought Factor, The
Activision			Pastfinder
AdventIntl			Rally Speedway
Atari	CXL4001	1979	Educational System Master Cartridge
Atari	CXL4002	1979	BASIC Computing Language (version A and C)
Atari	CXL4003	1979	Assembler Editor Computing Language
Atari	CXL4004	1979	Basketball
Atari	CXL4005	?1979	Video Easel
Atari	CXL4006	1979	Super Breakout
Atari	CXL4007	1979	Music Composer
Atari	CXL4008	1981	Space Invaders
Atari	CXL4009	1979	Computer Chess
Atari	CXL4010	?1979	3-D Tic-Tac-Toe

Obviously, I have access to the newsfeed. I'm getting it off a pseudo
BBS here in Utah. I dont have FTP acces unfortunately, but can mail out
to all sites by address. I also have Usenet access on this systm.

Well, thanks for all your help anyway, Jim McWilliams.

Right now, I've just been copying that section of code out of David Richardsons DD3 manual and importing it into my documents to print Gr8,Gr9,PS icons on my documents, lables, etc.

It works for now - but would rather KNOW how to do it myself rather than importing the code each time. hehehe

Source record: 108663

Well, I got my first issue of AC about 2 weeks ago - and just mailed out
$34.00 for my subscription (I'm getting the disk too). I sincerely hope
we get over 600 subscriptions - as I'd like to see it become a MONTHLY
magazine.

$25.00 for six issues is a bit steep, but worth the effort of such a
monumental magazine.

Source record: 108668

About another $30 minimum. This assumes you'd settle for 1200 a 1200 baud Atari SX212 modem. It's not a bad modem since it can be used on both 8-bits & standard RS232 systems like the IBM & ST. B&C Computervisions also has a PD VT100 emulator (PPD037) for $3.99. I'm not sure if you have to get the SX-Express package for the modem, they want another $10 for that. You could be talking about $44 total *IF* you don't know someone with an Atari to D/L the software for you. Hmmmm. Looking at the catalogue, they don't mention SX212 compatability for the VT100 emulator & say you have to run "The Fix XL". There's also Omnicom which I've used & liked, but I've always had trouble geting to D/L files properly. Anyway, unless someone jumps up & says "I'll sell you a SX for $10", B&C's #(408)986-9960

4571. genlock?

actually its about 269 messages a minute..... and I have the logs to
prove it.... others have seen them and they believe it... I have seen
the same toss rates on other 386 systems and it is not at all
unusual... there are some tricks to getting this to happen but you
would not believe me anyway <grin>

I'd recomend talking to Bob Wooley via the SLCC @ P.O. Box 1506
San Leandro, CA 94577-0374
He can get you reprints of articles that were printed in their
news letter. I for got how much it cost, but I recall it was only
a couple of $10's.

Stop your moaning you lot that haven't received your free issue of Atari Classics! We here in New Zealand haven't received ours yet and if (as I suspect) they were posted surface mail I don't expect to get mine until the middle of January .... of course being over Christmas it could take another month after that! AND on top of that we have to pay twice as much as you for our yearly subscription.......woe is us from 'down under' *8-(

Wrong. The demos. aren't illegal. (that I know of!) They're distributed by K.O.Distributers here in California. I talked with the guy (he sent me those games as well as the "APS Picture Show" for EscalPaint (by Mapda in Germany).

Anyways.. the names of the authors on at least these demo screens are definitely NOT English! And the text scroller at the bottom of "Fred" doesn't have the best grammar.

Than again, this could all be fraudulent. I'd contact K.O.Dist. if you seriously doubted the legality of the demos. I don't...

James King (uplherc.upl.com!neb!bbs!1fa) writes:

>[...] Has ANYONE ever
>successfully used the 850 parallel port without modifying their printer
>or loading up some sort of P: handler first???

I use a Panasonic KX-P1091 (Epson-compatible) dot-matrix printer with
the 850 on my 800XL. ALL of this is "stock." No custom drivers/cables/
other.

I do have to make sure the pirnter is set to "add a line-feed on receipt
of every Carriage Return." It might also be worth noting that this is the
OPPOSITE of "what works for a PC."

Chris_F_Chiesa@cup/.portal.com

4578. XEP-80

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-09 05:13:39 UTC
From: tatmanl@terapin.com
Message-ID: <tatmanl.2mex@terapin.com>
Source record: 108674

Does anyone have a complete listing of the commands that can be sent to the XEP-80? I have the master disk and all of the files that came with it including the doc file, but it doesn't list all of the commands...like how to turn expanded or underlined output on. Or, and this is what I am mainly looking for, How do you turn off the XEP printer port so that if you have a printer hooked up through a Black Box, you can send the info there to be printed instead of through the XEP's printer interface?

If someone can at least tell me the printer port answer it would help, but a full listing would be great.

Thanks.

4579. Need Action! help

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-09 06:22:37 UTC
From: jjmcwill@mtu.edu
Message-ID: <1992Dec9.062237.14855@mtu.edu>
Source record: 108673

The following is a code block from a program I've just started working on.

It's acting strangely, see description following the Action! code block.

```
DEFINE begin="DO",
end="OD",endif="FI"

INT FUNC getnum()

INT counter,loop1,gnumb
BYTE k
BYTE ARRAY keystr(9)

Open(1,"K:",4,0)
keystr(0)=8
FOR loop1=1 to 9
begin
keystr(loop1)=32
end
counter=1
k=48
WHILE ((k#155) OR ((k=155) AND (counter=1)))
begin
k=GetD(1)
IF((k>47 AND k<58) AND (counter<9)) THEN
Put(k)
keystr(counter)=k
counter==+1
ELSEIF(k=126 AND counter>1) THEN
counter==-1
Put(k)
keystr(counter)=32
endif
end
gnumb=ValI(keystr)
Close(1)
RETURN (gnumb)

PROC main()

INT number
BYTE race

race=33
number=getnum()
PrintE(" ")
PrintIE(number)
```

```
number=getnum()
PrintE(" ")
PrintIE(number)
PrintE(" ")
PrintBE(race)
RETURN
```

getnum() is a bullet proof number input routine.
The problem is, every time after the first time it's called, the
routine gets executed twice in a fow, but the result of the last
execution being returned to the calling routine.
In this code example, if you first input 22, then 22 gets printed,
then you have to input say, 56, then 47
47 gets returned to main() and printed, and then
33 gets printed, as that is the value of the BYTE race.

With Trace on, it shows that clearly getnum() gets executed twice
and I can't for the life of me figure out why. I'm using
the 3.6 version of the cartridge. Please please, can someone help!

Hmm. The situation with my printer problems is like this:

I have two Atari computer stations. One is running a 20meg hard drive on an MIO, 1meg 130xe and 1200baud modem. This is my private work station. The other computer runs the BBS, it runs on an 850 interface, Supra Hard drive interface, 120meg hard drive and 256k 800xl -- both computer stations are tied into ONE printer via a parallel switch box. I can print to the printer just fine via the MIO (with the printer factory settings), but when I print to the printer on the BBS computer (via the 850 parallel port), I get no LF/CR combo - making the printer worthless on the BBS.

If I force LF to ON via the dip switch settings on the printer, it would make the printer useless on the MIO based station.

Caught in a Catch-22 it seems. (GROAN!)

Message-ID: <71315@cup.portal.com>
Source record: 108675

No big thing, but you're mixing data types so you have to be a little careful. I never really 2X checked on this, but I believe when you request a byte array in Action! you get the exact number of bytes you request i.e. byte array keystr(9) gives you 9 bytes numbered 0-8. I always cheat & ask for more then I need rather then figure it out for sure <G>. Anyway, change loop1=1 to 9 to 1 to 8 & it should work. What must of been happening was the 32 was stored in code so it ended up being a JSR??? A cheaper way of doing it for small strings is just: Scopy(" ",keystr)
If I recall, this will automatically stop copying at the end of keystr. So you can give it 20 <spaces> then print out the keystr(0) to find out how long the string (converted array) really is.

Has anyone submitted an article to AC yet? Just wondering where they are going to get all their page fillers. I am currently working on several articles that I hope to have sumitted within a few weeks (most from old compiled information from Z*mag, Compute, Analog, Antic, and home-made hacks, etc..)

Does anyone know if there is any type of 'policy' on article submissions] Is there a specific format that needs to be followed when submitting any information?

Also, is AC going to be used in a Q&A manner - where text is submitted in the form of a question - to be answered by other readers later on..??

From: brownan@vax.sonoma.edu
Message-ID: <1992Dec9.122107.1@vax.sonoma.edu>
Source record: 108681

Hello out there!

I have a question for people who might program in c on the 8bit.

I have been planning to do some text game programming using c,
but when I went to look at the documentation for lightspeed c,
it doesn't have any structures or unions. Is there another c
compiler for the 8bit that might take care of this problem? I
do know how to get around it, but it is too much of a pain. If
there isn't one out there, I guess that I will have to do it
the hard way.

Another thing is that I would be interested to find a 2400 baud
modem(hayes compat of course) that is used. get back to me
and we could negotiate. I am also looking for an xep-80. If
anyone can help, let me know.

thanx
Anthony Brown.

Hmm, I thought there was an option in the MIO Menu that allowed you to
specifiy how the MIO sent CRs and LFs, so maybe you could look into that.

Wow, terrific sounding systems!

"Moonlight Workshop", a column run by yours truly, will also be serving as
a Q&A column. If I don't have the knowledge to answer the question fully
myself, I will pass it on to other members of the AC staff for consideration.

"Official" questions can be sent to me at the address in the signature below.
If the question is something I can sink my teeth into, the result will be
like what appears in the premiere issue.

4590. Questions: some hardware, some software

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-09 23:21:27 UTC
From: Christopher Rimple <crimp@microsoft.com>
Message-ID: <lv9q-kc@microsoft.com>
Source record: 108692

[I sent this to the Info-Atari8 listserver and saw it appear in a subsequent edition of Info-Atari8 mail, but got no responses. I'm assuming that messages sent to Info-Atari8 are NOT posted to the Usenet newsgroup, so I'm re-posting it there in the hopes that people will see it.]

I've got a 48k 800, 64k 800xl, Trak AT-D4 and Indus GT drives, and an 850 interface. These days, I use my Ataris mostly for game playing, and I haven't done anything serious with them since before Turbo Basic came out. Reading the first issue of Atari Classics has gotten me excited about them again, so I've got some questions.

1) What's the latest version of Turbo Basic and where can I get it? Is it on the FTP archive?

2) Can I expand my 800 above 48k and, if I do, is there any software that can use the extra memory?

3) I'm still using SmartDos, but everyone seems to think SpartaDos and MyDos are the best available these days. What's the latest version of MyDos and where can I get it?

4) I got a Koala Pad with my 800xl when I bought it used, but no software. What programs support it and where can I get them?

5) There are a few games in which text appears upside-down when played on my 800. I've replaced my Rev. A OS card with a Rev. B, but that didn't solve the problem. Is there some other chipset which must be replaced? My 800 was bought new in May, 1980.

6) I see lots of hardware expansions for the 800xl, many using ports that aren't present on the 800. Is there any way to add a hard drive to an 800 and, if so, how?

Most of the vt100 terminal emulation I used on the 800xl had 40
column mode only. When I finally found one that had 80 col
capability it was real slow and the print size was killer on the
eyes. I did find a 40/80 col. os rom that came with a vt100
emulator on disk, but you could only do ascii captures for
file transfers. I think the chip was called BOSSXL or something
like that.

RE: WOw! Terrific looking systems.

Thanks. I'm what you might call the crazed Atari fanatic. I've gradually built up some of the BEST 8bit systems available. Next purchase will consist of the MUX and Blackbox with 1.44 meg disk drive(s) from CSS (bob puff).

I've already created a 720k 3.5inch disk drive setup *2 using stripped down Percomm controllers.

My 8bit makes my IBM look pale by comparison (I have a 386dx sitting next to these two 8bit stations).

Message-ID: <1992Dec10.044713.17992@mtu.edu>
Source record: 108686

Rick,

Heh heh, that's what I get for trying to convert an old piece of CLSN Pascal code to Action! while my 3 year old daughter is crawling all over me saying, "what's that Daddy?" to everything I am doing.

It works... now another question.

I tried using the Procedure Godos()

which is declared as follows...

```
PROC Godos()

[$4C $0A $00]

RETURN
```

I think that is right... and it locks up when I execute that... for example, if I write the object code out to disk, drop down to Sparta-X, and then do a

```
CAR PROGRAM.COM
```

the program runs okay, but then locks up horribly when it reaches the end, doesn't matter if I have the godos() in there or not. Any ideas on how to be more Sparta-X friendly? Grrrr..

The reason I dropped down to DOS to run the program in the first place is this:

Some of the program outputs to 80 columns, so I drop down to DOS, load in my XEP80 driver, and then do the

```
CAR PROGRAM.COM
```

command to activate the cartridge and run the compiled program, to check out how the screen output looks. Actually, the program checks to see what the RMargin setting is, and changes some of the output accordingly, but I still want to check it out... hence the reason I'm dropping down to DOS to execute the object code, hence the problem I am having with DOS locking up on me.

I am a new reader of this newsgroup and wanted to say that I have had trouble downloading
.arc file to the Unix system on campus
before downloading to the SX212. I thought I could type the command 'cat <'
in order not to lose the elusive control codes, but it seems that the problem
could be my communications program. Could I try to change something on the Unix
system before downloading from either the archive to it or from it to the
SX212? (Oh, I already tried various combinations of the 'e', 't' and 'v'
options in the 'cat' command.

Any help would be greatly appreciated. Thanks.

Jay
rjmashl@quads.uchicago.edu

You might want to try phoning Atari Base @(408)745-2196 (I think?).
They have a copy of C65 or something like that's supposed to have
a complete<or almost> set of 'C functions. It's supposed to even
recognize a {} vs $( )$ that other Atari C's use. I D/L'd it, but never got
beyond reading the docs.

4597. Re: XEP-80

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-10 05:45:19 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1992Dec10.054519.15605@news.ysu.edu>
Source record: 108693

OK...what you are looking for is in the XEP manual and on the
disk....print out the doc files on disk.
There is a program on the disk called PRINT.BAS which configures
the autorun.sys file (xep80 handler). I am including a copy of
the "fixed" version of the program (because the one on the atari
disk has an error in it).
I'm going to send PRINT.BAS and an interesting note from Matt
Radcliff on how to use it. Also in the next msg I'm going to
send you a nifty little check book balancing program I wrote
that uses some of the goodies that are on the xep80 but you
have to use atari's handler not the one in SDX cart (the sparta
cart doesn't support graphics);
Here's the PRINT.BAS

```
100 REM PRINTER CONFIGURATION PROGRAM
110 DIM A$(2048),IN$(16),OUT$(16):REM ALLOCATE STRINGS
120 IN$="D:AUTORUN.SYS":REM READ THIS FILE
130 OUT$="D:PRINT.SYS":REM CREATE THIS FILE
140 TRAP 32000:REM IF NO AUTORUN.SYS
150 OPEN #1,4,0,IN$
160 TRAP 180:REM TO CATCH EOF
170 A=A+1:GET #1,B:A$(A,A)=CHR$(B):GOTO 170:REM BUILD INPUT STRING
180 CLOSE #1
190 I=136:? "AUX1 VALUE";:INPUT A:REM PRINTER AUX1 BYTE
200 A$(I,I)=CHR$(A)
210 I=137:? "AUX2 VALUE";:INPUT A:REM PRINTER AUX2 BYTE
220 A$(I,I)=CHR$(A)
230 OPEN #2,8,0,OUT$
240 ? #2;A$;:CLOSE #2:REM WRITE MODIFIED STRING TO FILE
250 END
32000 ? "FILE NOT FOUND"
```

Now here's MatRat's note from GEnie
----
as P1:, P2:, or completely disabled -
with the PRINT.BAS utility. The
information on how to do this is
hidden in the technical documentation,
however. Do you have a P:R: or 850
interface out there? Where is your
printer connected, to the 850/PR or
the XEP80? I expect that your printer
is on the 850 or PR, but the XEP80,
when in use, is trapping all your P:

output --- and the configuration of
the XEP80 handler your using EXPECTS
the printer to be attached to the XEP -
it sees that it's not there, and
returns an error. Error 136 is END OF
FILE - I doubt that's the error you're
getting. Maybe 139?

If it's OK with Atari, I can upload
several PRE-Configured versions of the
XEP80 handler where the XEP80 responds
to P1:, P2:, or NONE OF THE Pn:
addresses.

Thanks Mat*Rat, hmmm I printed out and
read Atari technical file and didn't
notice that the XEP80 and printer port
could BOTH work, great to hear, I will
admit, Atari may be quite late with
AtariWriter 80, but they did do an
excellent job with including
information with the dapter, thats
certain a major point on their side,
and Thank you Atari for allow
uploading of the XEP80 handler....

Category 10, Topic 26
Message 38 Mon May 30, 1988
MAT.RAT at 01:31
EDT

To configure XEP80 P: handling:

Load "PRINTER.BAS" and change line 240
to read:
240 ? #2;A$;:CLOSE #2:REM WRITE

MODIFIED STRING TO FILE

Note the program reads ?#1, which will generate a BASIC error. Save this version and then RUN. You will be asked for values of AUX1 and AUX2, after the AUTORUN.SYS file for the XEP80 has been read in. You will normally enter a ZERO, 0 for AUX2. For AUX1, use one of the following values:

AUX1=0 -- P1: goes to XEP80, P2: goes over SIO bus to any other printer interface that may recognize the P2: address.

AUX1=1 -- P1: and P2: go over the SIO bus, the XEP80 printer port is disabled

AUX1=7 -- P1: goes over SIO bus to 850, PR Connection, whatever. P2: goes to the XEP80.

These seem to be the only meaningful values for AUX1. This program will create a new file called PRINT.SYS. Go to dos and rename AUTORUN.SYS to XEP80.SYS. Then rename PRINT.SYS to AUTORUN.SYS and reboot. If you have an 850 or PR Connection, you'll probably want to use an AUX1 value of 7, or 1. This should solve your printer problems.

From: troyer@nynexst.com
Message-ID: <TROYER.92Dec10124223@finmark.nynexst.com>
Source record: 108700

Hello All,

I'm proud to say that I got my old 65XE and 1050 up and running after sitting in my hardware archive for a few years. I'd like to get some new software for it however. There seems to be some interesting stuff on the internet, but I need a way to get it to my atari. I see two possible ways: via a modem or via a floppy. I know there are some utilities out there for the PC that can write DD disks, but my vanilla 1050 no habla that. I have a modem, but no way of hooking it up. So I pose these questions:

1) Anyone selling a DD drive or an 850? I might be interested.
2) Are there any u-doit hardware projects out there that will let me get an RS232 serial port? How about modifying a 1050 for DD? How complex are those commerical hacks (happy somethingorother was it?)

Id also be interested in any other hardware projects (ram expansion for 65XE, anyone?) that might be out there.

BTW, I built one of those weather-fax decoders long ago that was in Compute or Antic (one of them mags). I don't get any use out of it. Is it worth an 850 to anyone? (Might as well try).

Well, any info I can get would be greatly appreciated. Thanks.

I think you meant [$6c $0a $00]. There is a patch for SD/Action!
somewhere. It's a simple solution, like putting a TSX at the head
of your code & storing it somewhere safe. I think it was even published
in a MAT*RAT program in Antic or Analog. I've got to get my mag collection
out of the living room anyway, I'll look through them when I move them.
With the patch in your code, it returns to DOS via the RETURN in Main().
a much more elegant solution. BTW: you don't have to a Proc GoDos():
You can just have the code block as the last line of Main() before
a RETURN.

Jay,

Your description of your problem is a little vague, but I THINK what
you might be interested in is UUencoding your file before transferring
it to/from your Atari and your UNIX machine. Your UNIX machine should
already have uudecode and uuencode, and there is a BASIC UUdecoder
on the Atari archive for the 8 bit in listed form that you can transfer
to your Atari in straight ASCII format. THen using that, get YAU.ARC
from the archive, uuencode it on your UNIX machine, use Kermit 65 to
transfer it to your Atari, uudecode YAU.ARC using the BASIC decoder.
You now have machine language uudecoder and encoder for your Atari 8bit.

Clear as mud? If you need any more help, feel free to ask, most of this
is also in the FAQ.

Rick,

Great, if you could dig up that patch, I would really appreciate it.
I'll try the $6C $0A $00 code block.

James,

E-mail to you bounced, can you provide an address?

Well, I own three XF551 drives, and will soon have
at least two of those modified to 720K drives. I use my 1088K in my 800XL as
a poor man's hard drive, keeping the system running almost continously.
ONE day I'll get a Black Box and hard disk.

4604. Re: Need Action! help

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-10 18:38:03 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <71422@cup.portal.com>
Source record: 108699

```
Well, mucking around. I wrote this &
the code it generated via a *1536
from the monitor:

Set 14=$600
Set $491=$600 all in hex

PROC GoDos() 4C 03 06
[$6c $a 0] 6C 0A 00
RETURN 60

PROC Main() 4C 0A 06
PrintE("HELLO WORLD") 4C 19 06
followed by the text string
A2 06
A9 0D
20 6C A4
GoDos() 20 00 06
RETURN 60
60 <???>
The 2nd 60/RTS is an obviously compiler being careful just in
case you forgot to put a RETURN at the end of main.
This is equivalent to a ML.SRC (Sorry, no line numbers &
maybe a mistake or two) that is compiled to disk:

DOSVEC=$A
CARTPRINT=$A244
INITAD=$2E2
*=$600
GODOS
JMP P1
P1
JMP(DOSVEC)
RTS
MAIN
JMP P2
P2
JMP P3
MESSAGE
.BYTE "HELLO WORLD"
P3
LDX #MESSAGE/$100
LDA #MESSAGE&$FF
JSR CARTPRINT
JSR GODOS
```

```
RTS
RTS
*=INITAD ;appended to a saved file
.BYTE MAIN
.END
```

BTW: This SEEMED to work alright when called from SDX, but...
I did the same thing with:

```
PROC Main()
PrintE("HELLO WORLD")
RETURN
```

AND! SDX prints out TWO "HELLO WORLD"(s)
What's happening is SDX sees the INITAD & JSR to it, then when it doesn't find a RUNAD, it JSR's to the 1st byte of the file! So in the first example where I had GoDos() as my 1st procedure I exited from the initiation through DOSVEC, SDX jumped back to the GoDos() thinking it was the right place to run the file but got bounced back via the [$6C $A 0]. I KNEW THERE WAS A REASON I DIDN'T LIKE THAT GODOS() THING! Besides corrupting the stack pointer, it won't work with SDX unless it's the first procedure in the source code. BTW: something that will work just as well is:

```
PROC SDXdummy()
RETURN
PROC Main()
PrintE("HELLO WORLD")
RETURN
```

What was probably happening to you was SDX was jumping to the 1st procedure in your code which may not of had variables etcetera pointed in the right direction (assuming it wasn't a programming faux paux) ergo crash city or a RETURN (aka RTS) to parts unknown. Well, one less bug, oh I mean FEATURE, to worry about! I'm sure the author of Action! wanted to use INITAD so you could create huge sequentially running files with the copy /A & I'm just as sure the SDX authors wanted to be able to save a few bytes by always having the start of .COM files at the 1st byte.

Soap Box Attack! Everyone has my permission to completely ignore me<grin>. #1 With the SDXdummy() at the head of your code there's no reason to use that @#$% GoDos(). I'd really encourage you or anybody else to just stick with the RETURN at the end of Main() to get back to DOS. Just use it if you're willing to admit you've loused up some critical memory area or hardware register so bad you can't RETURN from your program, but are willing to go back to DOS with a questionable set-up (I've done this myself). If there's any other real problems with it, let's figure them out & fix them. That way programs can call other programs which call other programs & the stack will always return us where we want to be. #2 This is the way I like to discuss problems/bugs. None of that hysterical "This program is trash because I heard my brother's,

mother in law's, uncle's, cousin lost a file!" I am willing to spend considerable time & effort working on stuff if the problem is just accurately described as Jeff did. It's not that hard & a lot of fun. I'm still learning & Jeff's problem was a problem with all my programs too; I just didn't realize it until he pointed it out.

4605. 3.5 Drives on the 8 bit

Obtain an old Percomm disk drive - the one with the green controller
card & printer pin connector on it. Simply remove the 5 1/4 drive thats
in it, and affix (it will be obvious how) a 3.5inch 720k drive mech
inside the case. Boot up SmartDos and format it out. You now have a
functional 3.5inch 720k disk drive for your 8bit - and its direct
connect via SIO.

YAY! I made a digi-song!!!! YAY! I sampled some bits of a song called "Knives and Forks" and remixed it all together (that Parrot structuring DOES come in handy!) into my own little song.

The demo is called "KNVSFRKS.ARC" (I'll get it to the archives a.s.a.p.) and requires an XL/XE OS (as it uses TurboBASIC XL.. :(enough for protecting my software! ;)) (although it is compiled).

The arc consists of only three files: RUNTIME.OBJ (hmm..couldn't be the TBXL runtime pkg, could it!?), KNVSFRKS.DIG (the samples-file), and "AUTORUN.CBT" (the compiled TBXL)...

just run RUNTIME.OBJ from DOS and have AUTORUN.CTB on D1:, and KNVSFRKS.DIG on the default drive (grrr...Runtime loads AUTORUN.CTB from D1:, while my program loads the .DIG from D:, which means it can be put wherever you want... which is good.. ie, use a ramdisk or HD or something :))

well... have fun.. it's my first try, give me a break if you hate it! ;)

```

Well now that I've printed awhile I thought, yeah wanna print some
graphics aswell, turns out that XEP80 CANT do Light translation with CR only?
In XEP doc It tells you to enter AUX#1=0 & AUX#2=4 for light transl&CR, but
it turns out do do Heavy translation &CR, anyone experienced this aswell?
So when I try to print from Graphics Art Department it puts alot of ^R^ stuff.
When I load with original XEP-settings (0,0) it prints graphic, but with an
empty line in between.. odd...

On Sunday, 20 Dec 1992 11:36:49 EST,
Jeff McWilliams <JJMCWILL@MTUS5.BITNET> writes:

>> "We --STILL-- don't have any kind of 2-d CAD program,
or a schematic design program. For me, as an engineering
kinda guy, these are a must." <<

Not exactly true.... When the ATARI 800 first came out, there was (and
is) a program written in ATARI BASIC that imitates a "RAMTEK" class terminal
and allows for design layout. The programmer included a blueprint of his
living room as a source data for the program. I believe that the current
version of this program is called "CADXE" and the original program was
called something like "CAD3" or "3CAD". There is extensive documentation
accompanying this program, formatted in 40 columns. There is also a
"documentation viewer" program written in BASIC that comes with it,
although it does little more than copy bytes to the "E:" device. I would
recommend using TEXTPRO or T:EDIT to view the text documentation. The
program itself is quite good. If you like fooling around with DEC
R.E.G.I.S. commands, the IBM "Telegraf" package, TEKTRONIXes, or the language
"ARTSPEAK", you will enjoy using this package. I suspect that many people
doing graphic design on the ATARI 6502 8-BITs probably used ATARI LOGO,
since it was available in many schools. (At one time ATARI was considered
the premier LOGO computer until APPLE rolled over them and TI also came out
with a LOGO cartridge. There was almost what would be considered a LOGO
war to see which machine would capture the educational computer market.)

4615. Wish List (was: comp.sys.atari.8bit.archive)

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-21 14:45:18 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1h4l9uINN10f@usenet.INS.CWRU.Edu>
Source record: 108561

In a previous article, JJMCWILL@MTUS5.BITNET (Jeff McWilliams) says:

>technology. Atari Classics prints a wish list in the magazine, so
>you can look there for more ideas, and here are a couple more of
>my own. We don't need another word processor, unless it's something
>really special, maybe mixing the Bells and Whistles of Paperclip with
>the macro capability of Textpro version 5 and the 80 column output of
>Atariwriter 80 or Turboword 80.

I would LOVE to see a better word processor. For the last 3.5 years I've
been using AtariWriter 80 on my 130XE system, first under MYDOS, then under
SpartaDOS X. Nothing fancy, and a little buggy, but it works. Well, this
month I was going to use AtariWriter 80 some on our older 800 system at
home, but I couldn't get it running so I booted up my old favorite that I
hadn't used for years, Letter Perfect (v.6). Man, LP is a SOLID piece of
software, compared to AW80. It almost made me feel I've been using the
wrong word processor for the last three years. Batteries Included is long
gone, but LJK was around as recently as a year ago. I would pay him Much
Money to update Letter Perfect to support:

- any DOS (especially MYDOS and SpartaDOS/SDX)

- run from hard disk or RAMdisk.

- the XEP80 (It already support the Bit-3 80-column board, so you'd think
this wouldn't be so hard.)

- both XE and Axlon-type banked memory for text buffer.

So if AC is taking suggestions for it's Wish List, there's one of mine.

>anything because they think their ENGLISH is too bad (as mine is).

To all such people: I don't care how bad your English is, participate in
this discussion group!

>I read comp.sys.atari.8bit regularly (nearly every day) and everytime I
>come up there are at least 10 articles posted here. Not everyone has the time
>to read everything. If you read here once a week lots of articles would be
>deleted without reading them first. An .archive newsgroup wouldn't be
>as 'overcrowded' because there wouldn't be as much articles.

Do you read newsgroups other than comp.sys.atari.8bit? I mean,
comp.sys.atari.st sees around 75-100 postings a day, rec.games.video more
than that. I can't say I've heard c.s.atari.8bit described as
'overcrowded' before. (I agree, 10 message/day sounds about right for this
group.)

>There is really no reason for not sending them to the archive site. The
>newsgroup moderator shall do exactly this to give new aspects to this site.
>But a newsgroup has several advantages :
>1. Readers can respond and send follow-ups (published coordinated by the

>6. You publish it to people all over the world. The AC mag is mostly selled
> in the US (isn't it ?).
> Maybe combinating all three solutions of the problem (and there is one)
> would be the best solution at all.

These are all basically valid for postings to comp.sys.atari.8bit.

>Oh there are programs for that (I own at least one 2-d CAD program) but you
>Americans don't know of that because they were published in Europe.
>Guys you're not allone on this planet and everywhere are good programs
>written. And for sure, out here in Germany there are several great programmers
>for the little ATARI (think of TURBO-BASIC, never reached by anything else).
>This' no flame, but there are moments while reading this newsgroup when I

>think this is an US newsgroup (with local store infos and selling lists).

There's a simple solution to our ignorance of happenings on the other half of the planet. If we don't know something is available, then post here with the correction, I'm sure peopole would like to know about it. Like all core Usenet groups, comp.sys.atari.8bit is available worldwide, belonging to all areas equally. Like all core Usenet groups, postings of only local significance (like wanted/for sales) should properly include a Distribution: line, limiting propagation to the local geographic area. But since this is such a sparsely used group, complaints about such postings have been minimal to nonexistant.

>Think of the new newsgroup twice, because you, Jeff, are one of the
>guys having the knowledge to write articles for it. This has nothing to
>do with AC (I can understand why you stand for it here) and please DO
>stand together as ATARI users and do whatever is the best for this 'family'.
>I think, a new newsgroup AND putting selected articles to AC and the ARCHIVE
>would be the best way to inform the readers well...

Jeff will correct me if I'm wrong, but I believe AC is striving to be a worldwide forum for 8-bit Atari users.

Another consideration is that a small but significant number of participants of this discussion group do not have Usenet access, reading the Info-Atari8 Digest. These people would not have access to another newsgroup.

And again, the point is probably moot, because if we can not produce 100 Yes votes we simply cannot create another newsgroup.

I think all those articles should be simply submitted to AC via US Mail
or E-mail to B.Poehland (or via GEnie). If AC is going to remain alive,
we're all going to have to break down and contribute whatever we can.

I personally am working on multiple articles for submission to AC. I
just got my Authors kit in the mail two days ago.

Did realize they'd be willing to pay $25.00 for each article. I simply
wanted to submit them to help out -- dont know if I'd take 25.00 or not
(maybe just once to pay back for the subscription costs) <grin>

Unfortunately, unless you can find a used copy, you're out of luck.
About 15 months ago, ICD said it would no longer sell products for the
Atari 8 bit line, and Action! was one of the products that they sold,
having bought it from OSS when they went out of business.

Yes, at one time way back when I had taken a look at LetterPerfect that somebody in my user group had owned. I had the Omniview 256, so for the heck of it I modified a backup of his disk to use its 80 column driver. With the extra RAM in the computer, I could set up a 90K ramdisk as D2: before booting up LP, copy the Spellperfect disk to it with a sector copy program, then do a cold boot to get into LP, do the keyboard command to reactivate D2:, and presto! Instant Spell Checking! Spell Perfect was LOTS better than the spell checker for either turboword OR Paperclip in my opinion. The strange disk layout was the killer for me, I needed to copy files to/from DOS disks, and LP couldn't do that without dealing with some other odd programs. I agree, the things you mentioned would make the program awesome. I THINK the LJK guy is still around, last time I talked to Ben about it was a couple weeks ago.

OK Jeff, you said it about LJK 80 col. WP...I have an old 800 with
a Franklin 80 col board in it (broke now though) If the guy could
only modify to print to E: it would work on the XEP80 and the dos
...I had a program written by Chet Walters to go back and forth
between LJK dos and Atari dos--->and I'm not going back to atari
dos for anything<---If I could run it from sparta then I could
put it on the hd. but you can't even see the dir. from any dos but
LJK....That would be a good thing to put on the wish list...I'd pay
the guy too.

Joe,

Okay I will send something to Ben about this. It can't be too hard
to modify the thing for the XEP80, because it outputs to the Omniview
256. On the other hand, I think you might lose 1K for the XEP80
handler which would have to be loaded, but compared to the 8K you lose
when Omniview goes into Graphics mode 8 to do 80 columns, it wouldn't
be bad at all.
I suspect the directory problem is because it was written in Forth,
and thus, like ChromaCAD XE, some oddball directory format is used.

Hmmmm... It would be a good idea to double check exactly what UUENCODE does, but I believe it's based on 64 characters. Since it's based on only 64 characters(I think) it only gets about 5 of 8 bits for each character ergo the the 1:1.5 expansion. I looked at a couple of refs for ASCII. 0-31 => control characters, <esc>, etcetera. 32-126 => straight characters & puctuation. 127=> <DEL or Back Space>. It looks like just the right amount for what I propose i.e. base 85. Base 86 or 93 or whatever would work too for that matter.
This thing has almost got me excited. I don't know how much UUENCODED goes around (since I try and avoid it <grin>), but this encryption scheme seems to good to be true. Makes me wonder if I'm really right & if so, why did everyone else miss it? Shrinking those UUE thingies by 25% seems like a desirable goal.

Transferring a text file from a VAX through an IBM mainframe does strange things to some characters such as: Vertical Pipe, Backquote, Brace, IBM Cent Sign, and a few others, due to shifting from the ASCII to the EBCDIC character sets and then back again. Would your new UUENCODEr be able to handle the "special cases", due to "bad network translation" through a mailer somewhere in the message delivery path? It's something to think about (in any event)....

>> Maybe combinating all three solutions of the problem (and there is one)
>> would be the best solution at all.
>
>These are all basically valid for postings to comp.sys.atari.8bit.
No. c.s.a.8bit is not moderated, so there noone to coordinate knowledge and
follow-ups or corrections. This is the rason because unmoderated newsgroups
are not interesting for readers reading it not frequently. They don't get
the theme of a follow-up series so they don't post their opinion to the
group. If all this is linked into one article (without all the double lines)
all persons are able to get the whole thing.
Also, there is NO reason against a 2nd 8bit-newsgroup.
So just say YES and we will see, if there are 100 people standing for it.

>Jeff will correct me if I'm wrong, but I believe AC is striving to be a
>worldwide forum for 8-bit Atari users.
Okay, you're right, but I guess, most subscribers/readers live in the
US and Canada, don't they ?

>Another consideration is that a small but significant number of
>participants of this discussion group do not have Usenet access, reading
>the Info-Atari8 Digest. These people would not have access to another
>newsgroup.
That's correct. Why don't we handle this like with this newsgroup?
All articles in the 2nd ng will go to the Digest, too.

>And again, the point is probably moot, because if we can not produce 100
>Yes votes we simply cannot create another newsgroup.
Please Michael, don't be as negative as you are.
JUST SAY
YES
and you're the 2nd of only 100.

We'll see how much people there will be...

4631. Re: Kermit-65 source code

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-22 14:52:56 UTC
From: winston@merk.com
Message-ID: <1992Dec22.145256.8122@merk.com>
Source record: 108578

I performed an FTP request (called a "get" I believe?) of the KERMIT-65 source code. The good news is that the file was delivered to the requesting UNIX machine. The bad news is that the file was delivered in an "ARC" format as one large file of over eight hundred double-density sectors! What the heck am I supposed to do with this?!?? Needless to say, I gave it the old college try and downloaded it to my ATARI 8-BIT. On my ATARI 8-BIT I attempted to UNARC as much of it as I could. Unfortunately, the first thousand sectors or so contained mainly the KERMIT file transfer protocol (which very few people use) and the command line parser. I was hoping to find information about the VT100 terminal emulator. The file contained some interesting code, such as sections to translate C64 VIC20 screen "poke" graphics character codes (Speedscript character type) into ASCII.

Needless to say, I am placed in a "Catch-22" situation. The KERMIT-65 source files are --NOT-- in an ATARI 8-BIT format, but in some text format too large to be contained on an ATARI 8-BIT drive. I can not successfully download this humongous file to an ATARI 8-BIT and then UNARC it. Is there some way that I can UNARC this behemoth on a UNIX system? I know that UNIX uses COMPRESS, TAR, and ZOO, but I do not believe that I have seen ARC on a UNIX box before. Most of this KERMIT source file contains extraneous information, anyway. The part that I am interested in, namely the VT100 terminal emulator, probably comprises a small part of the whole work, however I do find the programming techniques employed very interesting. I just wish that there was some way to successfully examine the thing. I have often wondered why no further work had been done on KERMIT-65. Now I know why! You need to own another computer with a hard drive just to hold the source code! :-(Any help I can get UNARC-ing this program and cutting it up into smaller pieces... so that it will actually --FIT-- on an ATARI 8BIT machine and --BE USABLE--, would be greatly appreciated. Does anyone out there have any ideas how to solve this problem? Thanks.

4632. Re: comp.sys.atari.8bit.archive

Source record: 108577

bbs@neb (BBS System 801-572-4969) writes:

>I think all those articles should be simply submitted to AC via US Mail
>or E-mail to B.Poehland (or via GEnie). If AC is going to remain alive,
>we're all going to have to break down and contribute whatever we can.
>
>I personally am working on multiple articles for submission to AC. I
>just got my Authors kit in the mail two days ago.
>
>Did realize they'd be willing to pay $25.00 for each article. I simply
>wanted to submit them to help out -- dont know if I'd take 25.00 or not
>(maybe just once to pay back for the subscription costs) <grin>
But for the ones with internet or Digest access there will be no extra
costs if you pick up a new newsgroup.
To read and subscribe AC is for some reasons not the best solution for
everyone (especially for those in Europe/Asia/Australia/(Africa ?)).
Look at other comp.sys....newsgroups.
Do they say, we don't need more than one newsgroup ?
They are happy with all the newsgroups they have and every month there is
a new one...

You get money for the stuff you write. That's okay and I wish you good luck.
But see, there's a limitation for your articles. They have to be your work
and/or free of copyrights.

But if you post it to a newsgroup and don't publish it in a commercial product
there is the possibility (and I know that some guys will give their OK for it)
to ask old and dead magazine redacteurs/owners, if you can re-publish it via
internet for free (because noone except the users gains an advantage).
Especially in German there are a lot of (for Americans) UNKNOWN sources for
ATARI related material. I know what I'm saying. I own an ATARI library filling
cupboards over cupboards.

See Ya

Source record: 108581

Ryan,

There are two flavors of SpartaDOS that you should be looking for.
Neither is sold by their parent company, ICD though. ICD stopped
manufacturing stuff for the 8 bit about 1 year and 4 months ago,
and most of their stock has sold out since then.

What made SpartaDOS simultaneously both popular and unpopular among
users is that it looks a lot like MS-DOS, or in a limited way,
Unix. When you boot up the DOS, you don't get a menu like on
Atari DOS or MyDOS, but rather just a little prompt, like

D1:

if you want to get anything done, you need to know the commands
that get things going.

```
DIR D1:*.COM
COPY D1:MYFILE.DAT D3:
```

are examples. Actually, SpartaDOS isn't the first DOS
for the Atari computer to offer this "ease of use". OSS put out
OS/A+ and afterwards DOS XL way before ICD produced SpartaDOS.
Both of the OSS offerings were very similar to SpartaDOS
in the respect that they had a command line prompt and all that.
ICD took the idea one step further, and added time and date stamping
and subdirectories to the system. Every file, when you look at a
disk directory, will also show the time and date the file was
created or last modified.

If you don't like the Command line interface, there are still
traditional Menus out there for SpartaDOS. One comes on the
construction set disk, one on the "SpartaDOS Toolkit" disk, and
yet another is located on the SpartaDOS X cartridge.

The first one you should look for is SpartaDOS construction set.
On there you will find SpartaDOS 3.2d. This DOS loads part of itself
into the RAM located beneath the OS ROM, thus saving some space in
normal memory for things like BASIC, or Word Processors, whatever.
By far one of the best enhancements for this DOS is the Wedge,
which takes up your XE extended memory, and adds all sorts of
extra features, all of which seem to escape me now, since I haven't used
it for a couple months. Another is Prokey, which is located on the
SpartaDOS Toolkit disk. Prokey among other things will show
you which subdirectory on your disk you currently have open,
allows you to recall the last thing you typed on the command prompt,
and allows you to assign some commands to Hot Keys, called Macros.

SpartaDOS X was ICD's latest and greatest offering. It came on
a cartridge, with a slot in the top to plug in another cartridge,
like BASIC, MAC/65, Action!, whatever. Putting the DOS on cartridge
allowed ICD to add features to the DOS itself, and additionally
they put utility programs in ROM along with it, so that you wouldn't
have to wait for them to load from disk. SpartaDOS X is the DOS
I use in my main computer. Since I only have one copy, I use
SpartaDOS 3.2d, or a variant of it, in my other one if I have to.

SpartaDOS is good at mass storage, like hard disks, and 3.5" 720K
floppy drives. Either version of SpartaDOS can handle disk
sizes up to 16 megabytes. If you have a hard drive that is say
20 megabytes, you would have to make two partitions on the drive,
say, each 10 megabytes large, and they would appear as two separate
drives to DOS and your computer.

In order to connect a hard drive to your computer, you need
some sort of electronic interface that goes between your 130XE and
your computer. At this time, there are two options that I
can see. First, is the Supra Interface. Not too many bells and
whistles, and I don't know too much about it, except that
somebody bought it off of Supra Corporation, and to my knowledge
still lurks out there selling it.

The Black Box from CSS is the Mercedes of disk interface hardware
for the 8 bit. Not only does this box give you a hard drive
interface with all sorts of bells and whistles, it also
gives you a Modem and printer interface, and a built in machine
language debugger. You can add a disk sector editor/monitor program
to the device, as well as a floppy board. The floppy board will allow
you to connect IBM type floppy drives, even 3.5" 720K, 1.44 meg, and
5.25" 1.2 meg drives, and use them on your Atari, at very high
data transfer speeds.

One thing you need to know about disk interface technology:
The interface you buy for your Atari,whether it be Black BOX,
Supra Interface, or perhaps another called the MIO from ICD
(also not available from them anymore), they all offer a SCSI
interface for hard drives.

This means you can connect a SCSI drive directly to your computer.
You cannot connect an IDE or ESDI drive.
You can connect an MFM or RLL drive if you buy a SCSI to MFM
or SCSI to RLL interface. CSS sells both of these if you need them.
Since the interface is a SCSI interface, you can also use the
removable media type hard drives, like the SyQuest 44 meg removable
cartridge drive. What I haven't seen is drivers for
those new floptical SCSI drives or any CD-ROM type stuff.
But since there are probably few to no 8 bit users with this sort
of hardware, it hasn't surprised me.

Hope this helps a little, my fingers are going numb with this
terrible editor. Gotta go.

Jeff McWilliams

4635. [--- Lunar Calendar ---]

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-22 15:28:33 UTC
From: winston@merk.com
Message-ID: <1992Dec22.152833.8624@merk.com>
Source record: 108582

Hello! I noticed that your message was postmarked from Jerusalem and I was wondering if I could ask you a question? I am reading COMP.SYS.ATARI.8BIT on a UNIX system that uses a "CAL" calendar program to print out a solar calendar. Are there any calendar programs out there that print out a --LUNAR-- calendar that follows the, what is it, nineteen year lunar cycle? I have seen programs in the USA for the ATARI 8-BIT and other computers that will print out the solar calendar, yet I have never seen a computer program that does a lunar calendar. I wonder why I haven't seen such programs? I am sure that the large Jewish, Chinese, and Asian ethnic populations around Boston Massachusetts, would find a lunar calendar program useful. Such a program would be very useful for keeping track of the many religious observances that follow the lunar calendar cycle. I am curious... are there any programs for the ATARI 6502 8-BIT that can generate a lunar calendar?

4636. My Atari 800 has a power-up problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-22 15:38:43 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992Dec22.153843.13260@cbfsb.cb.att.com>
Source record: 108579

I have an Atari 800 with a power up problem: Sometimes (lately
very frequently) I won't get a video image at all, or a pattern
of vertical and horizontal bars for the video image. After flipping
the power switch on and off several times, I can coax the machine
to operate correctly. I tried opening the machine up and reseating
connectors, and chips in sockets, but that didn't clear this
problem. I also have an Atari 400 I am willing to steal boards/parts
from, any suggestions?

Kermit 65 was written and assembled on another system (an ST, I believe). The
ST was of course able to handle the size of the file, but it's kind of
impossible to work with on the 8bits. If you're only interested in reading
some of the code, you just need to unARC it on another system (yep, there
are Unix-compatible ARC's out there...), then either look at it on that system
or break it up for use on the 8bit.

If you want to change the code and reassemble it, your best bet it to use
another system and a cross-assembler. (Atari's Madmac assembler for the ST
will assemble 6502) If you can't get ahold of another system and assembler,
you will have to be very patient and inventive :-)

I hope you didnt misunderstand what I was saying in regard to submitting articles to AC.

I'm all in favor of ANYTHING for the 8bit, especially when it comes to this particular area on the Internet. If we can get another news group together, I'd be all for it, but the way it stands now - this one is scarcely getting much use.

What I'D like to see is more 8bit coverage in the Fido and Isis networks. (grin)

Jeff, just for your (and everyone elses) information, the Supra hard drive interface was purchased by Bob Klaas of K-products (owner of BBS Express Pro!) here in Salt Lake City, Utah (where I live).

It is being sold for around $120.00, and will very soon feature options identical to that of the MIO and Black Box - as an add on card has been developed to allow for menu configuration, high density disk drives, etc.. Look for the upgrade within a month or two.

For further info on this HD interface, call the Repair Shop BBS at 801-967-8738 or call Bob Klaas voice at 801-967-7400 or 801-966-1697.

>(also not available from them anymore), they all offer a SCSI
>interface for hard drives.
>
>This means you can connect a SCSI drive directly to your computer.
>You cannot connect an IDE or ESDI drive.
>You can connect an MFM or RLL drive if you buy a SCSI to MFM
>or SCSI to RLL interface. CSS sells both of these if you need them.

As I recall, the Black Box (and maybe MIO) does allow ESDI (or is it
EDSI?) connection in addition to SCSI. I could be mistaken, but I do
remember reading that long ago. (I don't have a BB or MIO, or even a
hard drive.)

Hey rick... hmm.. I killed the idea on AAcode (my version of
uuen/decode) I guess I just got bored. ;) anyways.. THE best
uuen/decoder would be one that compresses first! ooh.. that'd be nice...

my one complaint would be this:
I have it easy ;) .. the BBS I rec'v UseNet on has a built-in
UUDecoding command, so I don't even need YAU (just YAUE for the
occasional upload/post)...

but I supposed if one were to write something for (unix?) whatever the
archives, you could have 3 "send" commands:

send - send (uuencode if binary)
sendb - sned (uuencode no matter what)
sendx - send (x-encode) (x? whatever... whoever makes the program
will have the honor of naming it! ;))

... hmm.. have fun!
btw, rick.. I'm no math major, and I'm half alseep, but that
LOOKS like it might work... !?

4645. vblitz demo

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-23 08:43:51 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <sR98VB3w165w@cyberden.sf.ca.us>
Source record: 108593

grr... ICD made a big mistake w/ their RAMBo XL...

I got "VBLITZ" from the archives, and loaded it on my upgraded (256k, 800xl/800 OS) 1200xl and all it did was say "[fuji sign] 130XE"...

then I loaded it up on the motherboard (no keys/case/etc) of my old 1200xl (w/1200xl OS and 48k) and it showed two VERY cool looking landscape frames behind the fuji & "130xe"....

what the problem is... is that the RAMbo XL, when bank-selecting, selects the bank for all of the memory, while the 130XE's memory, when bank-selecting, selects memory for the CPU to look at, AS WELL AS memory for the video (ANTIC chip) to look at... so, when VBlitz thought it was telling an XE to have only ANTIC look at such&such a bank of memory, my RAMBo thought it was saying "look at this bank of memory" (taking the bit that would tell the XE "ANTIC only" as another bit in the bank # (as the rambo upgrades have more memory (16 banks) than the 130xe (4 banks)))...

I hope I'm not too confusing.. I'm just relaying what I took from what Bob Woolley told me...

anyways... I made two little programs in TurboBASIC XL (VSPLIT.TBS and VBLITZ.TBS) which do almost what that demo is supposed to do:

VSPLIT- opens the AUTORUN file from the VBLITZ disk (which contains the bitmap frames) and resaves the images onto the ramdisk

VBLITZ- consecutively reads the seperate images that VSPLIT made and dis-plays them on the screen..

inotherwords, I got the demo working, but very slowly, and w/o that snazzy fuji and "130XE" on the screen (which MUST'Ve been player-missles (not sprites, bob.. I remembered not to say "sprites"! ;)), because they were changing rainbow colors as the background moved (if I were to see it), and the background was in GTIA 16-shade 80x192 mode, while the 130XE and fuji were in totally multicolored 160 x 192...)

whew...
I'm tired ;)

About the "mammoth file too large to fit on an ATARI 6502 8-BIT disk drive" ARC incompatibility problem....

<* Sound Of Trumpet Fanfare... *>
Fortunately (for me) the System Manager was able to come through in this crisis. Yay! It turns out that there is a utility he has that is able to run an MS-DOS process as a child process within the UNIX shell environment. He keeps it around for just such emergencies. I was able to start up an MS-DOS subtask and run an UNARC-ing utility on the UNIX system, to unbundle the KERMIT-65 archive. (The file is immense!) I don't know what I would have done if I had been on a VMS, CMS, AOS, PRIME, or some other operating system. The unarcing was practically instantaneous... WOW! was that fast.

I tell you, starting up the MORE/LESS pager on the KERMIT-65 code was a very moving experience. When I got down to the 80 character graphics font definition I openly wept, the experience was so moving.... (I also discovered I few things I had never realised, like that the DEC special ISO GRAPHICS CHARACTER SET for VT52/VT100 was --ALSO-- available in --FORTY COLUMNS--. I never knew that you could draw ISO GRAPHICS in forty-columns! You can have a lot of fun with this! There were also forty column versions of LEFT-BRACE, RIGHT-BRACE, BACKQUOTE, and TILDE. I am sure that I had seen them before, but it never registered before that the ATARI 6502 8-BIT has --NO-- braces in its normal character set!)

Paging through the KERMIT-65 code was almost a religious experience; it was so moving. It was a thing of beauty to behold, and a joy forever! (Now if only someone would substitute XMODEM for KERMIT, and add MS-DOS ANSI GRAPHICS along with the DEC ISO GRAPHICS, you would have a VT100 that really *-ROCKS-* !) Just walking through the source listing I am really learning a lot. Thank you! Thank you ATARI Archive at UMICH. !

Ron,

This came up several months ago on here. As a second hand source of information on this, all I know is that Bob Puff didn't intend for UNLZH to be passed around, it was a beta copy, and he was pretty ticked when he heard about it. If this is still the case, let's show some respect for the current top 8 bit developer (leastways in my book) and not pass around something he doesn't want passed around.

Roger,

POKEY I believe handles most of the SIO stuff, so I would suggest start looking there. you could probably even swap your 65XE POKEY with the Atari 800 one, assuming you want to roll up your sleeves and dig into your 800. Another option would be to purchase a Transkey interface for your 65XE. This allows you to connect IBM type keyboards to your Atari 8 bit. Then, it would simply be a matter of finding a keyboard that felt right for you, making sure it works with the Transkey, and off you go!

Source record: 108603
Cross-posted to: comp.sys.atari.8bit,alt.games.video.classic

I was buying misc. Christmas items at Odd Lots the other day, and
noticed they had a whole shelf of Atari 2600 units (the new style)
for $19 each, and some 7800 consoles for around $25. There were also
several large bins of Atari cartridges- all in shrink-wrapped boxes.
The 2600 cartridges were $1 each, and the 7800 cartridges were $3.
There were many classic games, too, like Pole Position and Dig Dug.

Disclaimer I don't work for Odd Lots and don't know anybody who does.
Just passing along a tip in case anyone's been trying to find these items.
For anyone in Columbus OH, the particular Odd Lots store was the location
on Olentangy River Road.

Interesting question. I don't know of any such program for the 8-bit, but a local WWIV BBS has a calendar program in the login screen. I think the sysop wrote it, it shows the date in several different systems including Jewish, Moslem, and Mayan. I could ask the sysop if he's willing to share the source code.

I think the only way to lock out the configuration menu would be to disconnect the SELECT and/or RESET key. But if you change the hard disk configuration, a user would have to know where each partition begins, to access that partition. Then again, fooling around with that data could be risky. You can write-protect partitions, or disable them, but anyone who knows enough about the computer can undo that. You can put data in password-protected ARCs, if you don't mind unarcing the files each time you use them....
Another idea: the source code for Mydos is available if anyone wants to try adding password protection to it. I forgot: were you worried about people seeing/copying your files, or erasing them? If the latter, be sure you have backups!

One other possibility--it's expensive, and I don't know much about how it works, but CSS makes a device called the Multiplexer, which lets two computers access the same hard drive. I think only one computer has to have an MIO... You would have to ask Bob Puff, or someone who has one, for more information about it.

>from, any suggestions?
I can answer my own question now. I took both machines apart, and swapped
out the "CPU" board, this one being the only board common to both (except
for a memory 16K board). Turns out that swapping the CPU board removed
the problem from the 800, and placed the problem in my 400. So obviously
the problem is in the CPU board. Haven't taken the time to identify it
beyond that, as I achieved my main goal of getting the 800 alive.
Can anyone guess what chip or part on the CPU board might cause the
above power up problem?

No... you're right. I just wonder if he's still working on it. I have
a copy, and after I heard (on this net) that he (Bob) didn't want it
spread around, I asked the Sysops to delete it, and I haven't ever
uploaded it anywhere.

I have the same problem one time. In my case it was a bad "lid swith". (switch) I took my 800 apart and found that out. I replaced the mother board ($10) and everthing was fine. I found tho I cound use the board I took out by permanently closing the switch. Hope your situtation is as simple.

Wild Wookie.

Rick Michael Cortese here at Portal raises the possibility of an interesting alternative to UUencode.

First, Rick, UUencode turns 3 bytes of original 8-bit data (24 bits) into

4672. Re: My ego VS UUE

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-26 09:23:01 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <72423@cup.portal.com>
Source record: 108517

Oops... sorry about that partial posting! It's 4AM and I'm on an unfamiliar keyboard...

I was starting to say:

First, Rick, standard UUencode takes 3 bytes of 8-bit "original" data (24 bits) and reorganizes it as 4 6-bit "encoded" quantities (also 24 bits). Current computer architectures require an entire 8-bit byte to store any less-than-8-bit quantity, hence a UUencoded file has essentially 4 bytes for every 3 in the original: an "expansion factor" of 1.3333...., not 1.5. Among other things, this reduces the advantage of your proposed base-85 technique from "a significant improvement over UUencode," to "just slightly better," and since base-85 doesn't correspond exactly to a power of 2, i.e. to a particular, fixed number of bits in the UUencoded values, your encoding algorithm would of necessity be somewhat messier than UUencoding which can be implemented just by moving bytes around: NO MATH is needed for UUencoding.

Second, the use of 6 bits for UUencoded data values yields, of course, 64 different possible values. As noted in previous articles in this thread, the values 0-31 would be control characters, some of the very values it is desired to avoid in an e-mailed file, so the UUencode algorithm adds a "bias" value of 63 decimal, shifting the UUencoded values to the range 63-127 decimal, representing ASCII characters "!" through "~". These are ALL "printable" characters, in ASCII anyway. I don't think it should be the encoding program's responsibility to deal with ASCII-to-EBCDIC translation peculiarities; that is the responsibility of file-exchange software: the ASCII-file-reading program on the EBCDIC system, or the EBCDIC-file-reading program on the ASCII system. These exist and have been refined over the years to quite a high state...

Third, I think it would still be interesting to see a base-85 file-encoder, at least as proof that it could be made to work. I don't expect it would make any significant impact on the near-universal use of the existing UUencode scheme, since UUencode is firmly established and the base-85 encoder would be more complex, and therefore somewhat slower, than an equivalent (whatever THAT means) UUencoder, for only about a 8% improvement in file size. Of course, there will be that minority (possibly including me myself) to whom even an 8% improvement will be worth a loss of speed, and such people ought to have the choice.

Hi!!!
Does anyone remember a really neat telecommunication service called
Games Computers Play? It was available for the 8-bitters and then later
for the ST around 1985-1986. Does anyone remember CyberTank? I kind of miss
playing it, so I was thinking about writing a one player version of it for
Windows. I would like to use the original Cybertank map. Does anyone
have any information on it? I have the old documentation, but I was wondering
if the map was on a file that you got from GCP. Does anyone know what
the map file format might be or what the name of the file might be? Or was
the map on GCP's minicomputers? Thanks in advance.

RE: Point #1, I'll stand by my 1.5 expansion statement. Matter of fact, some of the files I D/L'd were that were in that 1.5 range were done by you. It's more then just a problem with the encoding scheme. I believe the UUE uses a 46 byte line with a two byte checksum for every line which would pump it up, the rest of the expansion I'm not sure about, but it DOES make the file 1.5 times the original. IMO: I'm sure the original authors had something in mind by adding a checksum to every line, but I really doubt if it serves a useful purpose anymore. Since most everything is transfered via Xmodem etc. it's more likely a bad file to begin with. A checksum for the entire file makes a lot more sense to me & apparently the authors of ARC, ZIP, ...

I'm aware of the bias & plan on the numbers being represented by ASCII characters from !-r or !-v, something in that range anyway. No control characters, no extended characters. I've already sent a file to myself on another BBS (ricortes@kludge.com) & I'll double check that everything gets through correctly. It shouldn't matter what character sets another computer uses *IF* (note the big if) they just echo the file as is. Who cares if computer X thinks a 65 in a file means "strip and go nude", as long as it echos the 65, were fine.

Point #3 Speed, I've already got a mutiple precision binary division routine that'll go to 255 significant figures for the operand/divisor. I'm planning on eventually getting it working as an Action! procedure along with maybe some multiplication. It may take me a while to get everything neatly done, but as long as I'm willing to code in M/L, you shouldn't worry about speed. If your really worried, I could run some tests, but even if there is a net loss in speed on the decode end, the online time/transmission/echos for the entire Internet system will be reduced by 15% (Only for files of course!). Who wouldn't take a slightly longer decode time in exchange for a shorter down load time?

BTW: I want to thank Douglas Clement for correcting my terminology on number base systems. My excuse is I was trained as a chemist so...

I guest for the doubters, I should do a little demo. Turns out Atari Basic can just manage to do the job albeit slowly. I'm sure somebody about :-)

Marc,

Well, I remember the service, but never subscribed to it. Speaking of which,
how is the multiplayer-multicomputer that Jeff Potter is working on going?
Anybody know? At one time I think I had a tank game you played with anothr
guy on a 2nd atari, with them linked with a joystick cable of some sort.
It was pretty cool. I would like to see more of those games, having
several 8 bits myself.

Jeff

4678. Re: Kermit-65 source code

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-28 07:25:22 UTC
From: winston@merk.com
Message-ID: <BzyKMB.CMJ@merk.com>
Source record: 108525

To All 6502 Programmers Out There,

I have been examining the KERMIT-65 source code files that I FTP-ed from the Atari Archive with a "get". I don't own a MAC-65 6502 Assembler cartridge, and some of the symbols used seem a bit strange. For example, what is the meaning of the pseudo-op ".SBTTL" ? Another interesting expression is "<byte>!<byte>" (...is that supposed to be a Logical NOT of two bytes?). Finally, in the KERMIT-65 "make" file, the "-v" flag is set. Is there a version of the UNIX "as6502" cross-assembler utility that even --SUPPORTS-- a "v" flag ? What assembler was used to generate object code from these sources, does anyone know ? Thank you.

4679. FORTH-83 for Atari 8-bit; anyone interested?

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-28 12:45:55 UTC
From: jimlynch@netcom.com
Message-ID: <1992Dec28.124555.2212@netcom.com>
Source record: 108526

I wrote one; it's very cool. Problem is, I didn't write a manual...

It has its (traditional) compiler and interpreter rewritten in assembler...
it has its I/O (the FORTH words KEY and EMIT) written so it can be redirected
to different IOCBs...
it has ADA-style exception handling set up so you can redirect particular
error conditions so you can recover (or at least exit gracefully); you can
also define your own exceptional conditions...
the compiler and interpreter can be stripped out of applications (this means
no runtime file and no extra baggage!)

If sufficient interest exists, I will look into writing a manual for the
features I have added and releasing the forth system and the manual as
shareware... for the shareware fee, I will include full source code and
the ability to make stand-alone apps. Runs under OSS-Dos.

Well, one thing I noticed is (this isn't off the subject, but it is totally useless information) that ARCing usually trims down a (set of) file(s) enough that when the ARC is UUEncoded, it takes almost exactly the same amount as the unARC'd, unUUEncoded data. Perhaps ALFing may be an even better idea (or does that compress at all? I've only seen a few ALFs in my day, and Bob Puff's SuperUnARC/UnALF 2.4 does the trick... I notice that ALFing stores ARCs, so it may be a better compression.

Don't quote me!

Just Do It !
I speak for three people owning an ATARI 800 XL. We are interested in
all kind of programming languages for the 8 bit computers.

Besides, those programming languages are the basic utilities of people
writing new programs and bringing new energy into the ATARI-8bit-machine.

If you can run MS DOS programs on your UNIX box, TASM may be up to the
task. Stands for (T)able driven cross (AS)se(M)bler or something like that.
I've only used it once to check it out & it produced an exact dup of
a Big Mac ASM. I believe it's FTP'able from some IBM sigs.

Source record: 108541

Well... some REALLY good DOSes out there are:

MyDOS (4.53 is the latest version), which is almost 100% Atari DOS 2.0/
2.5 compatible, and supports subdirectories, RAMdisks, high-cap-
acity drives, etc. I use it, and love it, and it's public domain
(getting it to your Atari w/o a modem or disk drive in the 1st
place is a trick, but I'm sure some PD wherehouses and/or 8-bit
stores that sell PD have it...)

SpartaDOS-X (version ??) I don't have it, never've used it or even seen
it. It's cartridged based, not being made any more, MS-DOS-look-
alike, commercial of course, and some 8-bit stores'll definitely
have it. Many people love this DOS.

SpartaDOS (v.3.2?) It's a lot like the above SDX, but is disk-based, and
is also commercial. It's also widely used, although it has some
quirks. I've used it before. I had no idea what I was doing,
and of course didn't like it because of that :).

If you like MS-DOS style DOSes go for one of the Sparta's. If you like
Atari DOS (vanilla-DOS) style DOSes (with menus), get MyDOS or any old
Atari DOS-type DOS, but the most widely used of this type of DOSes is of
course MyDOS. (It's now PD, that's probably why.. also, since it's so
used, many upgrades've been made, making it even more widely used, etc.)

So you have one way to go or another.

Also, for modems, there's the SX212 direct-connect (no interface
required), made by Atari, probably still being made (as it has an RS232
port, making it ST/IBM usable). You can get SX-EXpress!, which is a
disk-based terminal program for it for as little as $3 (it's PD) or as
much as $10 (grr..I got it for that).

For terminal programs, some people go the Express! way, and others (like
me! :)) the BobTerm way. BobTerm is PD, and Express! also comes on
cart. >>>I THINK<<<, which would of course be commercial. (Is there such
a thing as a PD cart!?... I mean, burning Eproms is just like copying
disks, eh? Just charge more for parts for the cart. People charge $$
for disks on PD stuff.. Interesting concept....)

Also there are terminals like DeTerm, which is pretty good (pull-down
menu driven, but not graphical). It can play breakout while doing xfers,
etc.

There's ANSI-Term (in beta, last I saw. v0.3), which doesn't support
color, runs in graphics mode (slow :( ), but does its jon
job

4693. Mini-virus for 8 bits

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-30 06:36:21 UTC
From: jjmcwill@mtu.edu
Message-ID: <1992Dec30.063621.22902@mtu.edu>
Source record: 108551

There is a sort of virus program located on the ICD BBS, and perhaps
other places as well. It is in the SpartaDOS Utilities section,
and I believe it is called SUPER.ARC.

It deARCS to the following files:

SUPER.DOC
SUPER.BAT
SUPER.EXE
SUPER1.SCN
SUPER2.SCN

the doc file says something about this being a program to super compress
all your hard disk files, and to just execute the batch file, by typing
in something like

-SUPER

well, even the EXE is only a few hundred bytes long, so I was immediately
suspicious of the program. Basically, I think SUPER.BAT copies the two
SCN files to the screen, which says something like "compressing files"
then "removing unwanted files" It then executes SUPER.EXE, which is
another batch file, which contains lines similar to the following in it:

ERASE *.ARC
ERASE *.TXT
ERASE *.COM
ERASE *.EXE
ERASE *.SYS
ERASE *.BIN

You get the idea, the program is nothing but a batch file for SpartaDOS
users designed to wipe out as much of your stuff from your default drive
as possible, and says something to the effect of "SUCKER!" at the end.
Not really a virus, more like a poorly designed Trojan Horse or something.
Nevertheless, there may be some people who wouldn't think to check out
the program before executing it. As an endless servant to fellow 8 bitters,
I thought it best to bring this little gem of a program to the attention
of the netters out there.

The mere fact that such a program even EXISTS on the ICD BBS is testament
to how much they give a darn about the 8 bit computers. Obviously their
BBS SYSOP doesn't check the program uploads before allowing them to
appear accessible to the public. If someone has the time, perhaps ICD
should be given a call to discuss this problem. At the least the program
should be removed from their BBS.

Have fun, and enjoy 8 bit computing.

4694. Looking for source code from Analog

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-30 06:54:33 UTC
From: jjmcwill@mtu.edu
Message-ID: <1992Dec30.065433.23008@mtu.edu>
Source record: 108552

There is a program in the January 1989 issue of Analog called Edit Magic,
which is for XL/XE machines. It copies the ROM OS into RAM, and then
patches the EDITOR to do all sorts of neat things. Their version
is obviously incompatible with things like SpartaDOS 3.2d, and
TurboBASIC XL, and whatever else. But I am working on a hard ware
hack that will place a STATIC RAM chip where the OS ROM normally resides.
That way, you can copy the ROM OS to the SRAM chip, make modifications to
the OS, and then disable the Write line to the RAM chip. From then on,
it will act just like the Original ROM OS did. What's more, you can still
access the normal RAM underneath the OS, just like you always did,
so that it's compatible with SpartaDOS 3.2d, TurboBASIC XL, etc.
I would like to get the source code to this Edit Magic program
so that I can modify it and use it as a perfect example of the kinds
of changes to the operating system you can make.

This hack will appear in an upcoming installment of Moonlight workship,
after I've debugged the circuit and done a thorough schematic design
and write-up etc. While I am at it, I would like to petition readers
to submit any other OS modifications that could be done to the SRAM-OS,
like high-speed DISK SIO routines, remapped 1200XL function keys,
hidden machine language monitor/debuggers, or whatever else.
One could even replace the diagnostic code with say a printer configuration
program that you call up with a special key sequence, where you could
choose FONT, pitch, spacing, and whatever else before printing a document.
Without divulging too much more about the upgrade, (I do want you folks to
read the column!!), you might be able to have about 16K of program space
hiding in there as well, actually, if you keep the ROM OS enabled, you'll
have 32K of program space!... anyway, so you could put some really
nifty things into this upgrade. Ideas anyone? Gentlemen,
start your assemblers! (varoom!)

Howdy,

I had and Atari 800xl with 256k ram that I gave to my younger brothers, but I had almost no software/info for it. I used to have a ton of disks for it, but lost them in one the various moving expiditions I have had. Anyone out there selling 8bit games and/or programming utils/books? I know there is a lot of stuff on atari.archive, but I have no modem for the 8bit and have no way of transferring stuff from my st to there 8bit. Any pointers? The diskdrive they have is a 1050. It is not happy/doubled etc.

John

P.S. Also I have a couple of things that dont run on it, anybody know where I can get the 8bit translater? Make the roms emulate the older 400/800 systems.

Hello Everebody

Let me start by Thanking every body who help me with my last post.

Can Somebody please tell me what is a MIO and a Black Box and where
I can get them??? Can they connect to an atari 800 and 1050??? If
I get them can I connect a SCSI or MFM hard drive??? What else would
I need to connect the hard drive? Do they have RS232 connection for
a modem??? If not where can I buy 850??? Does that have RS232 connection?
Is it possible to use a 9600 buad modem? :) Where can I get a copy of
Kermit-65 or buy it??? Please do not tell me to down load it from some
BBS. I need the disk. Thanks very much for any info.

Thanks for your time.
Raul

P.S. Have A Happy New Year!!!!

4699. Re: My ego VS UUE

Newsgroup: comp.sys.atari.8bit
Date: 1992-12-30 21:33:59 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <72633@cup.portal.com>
Source record: 108543

Well, if anybody is still lurking. I used some of the files I created with a Basic encoder/decoder to run some checks. I used Express on the Atari end & First Choice (an integrated package equivalent to our HomePak) on my clone. Turns out you run into a number of problems with this set up. Not the least of which is the `'. If your reading this on an Atari, those two characters will<may> look identical. This isn't just a problem with my encryption scheme since the existing schemes use those characters, it's a problem with Atari/Express. Atari uses a diamond <control .> as character 96 so every time Express sees a 96 in ASCII, it translates it to a CHR$(39). Needless to say, this wrecks havoc with the file integrity. There are two work arounds for this; [Xmodem, go to ATASCII]. ATASCII works fine for captures & send from disk *IF* you just remember to use <control>M instead of hitting the return key & you can always switch back to ASCII after the transfer/capture. I never bothered to check what the Atari version of UUDECODE does to avoid it (assume Xmodem?). One other problem I ran into with Express, it doesn't start the "CAPTURE" immediately. I had to send it one Atari <CR> to get it to save the first part of the file. I'm not sure what people do now since what little I do now is done on my ST or clone. It turns out just about EVERYTHING adds line feeds to carriage returns. This means that my encoding/decoding scheme had to allow for LF's just so you could "CAPTURE" posts in addition to Xmodem. The bottom line. It works, but has to suffer a little on efficiency because instead of just an single <CR>, you get [<CR>, <LF>] for every line. I kept my test lines short, 35 characters, so I could print out everything while it was being decoded so this adds 2 bytes for every 35 to the file size. Not really a problem since I could just increase the line length to 75 or so. My test file was 425 bytes long & ended up being 581 bytes or 1.37X the original. This works out because of the overhead & <LF's> the BBS's added: .BEGIN<CR><LF> 15 lines*(35 bytes/line+<CR><LF>) 1 line *10 bytes+<CR><LF> .END<CR><LF> I used UUENCODE.EXE on my clone for a 540 byte file & it went to 958 bytes or 1.77X. Since this was too fair to me, I used some larger files with the clone & got the following: original UUE X
34816 49707 1.43
7168 10389 1.45
So I don't think I was out of line saying UUE produces files 1.5 times their original size. The best it will do with an

infinitely large file would be about 1.43X original & when you get down to files around 8k (The kind that concern us) most of the stuff will be in the 1.5X range. I haven't run any long programs through my encoding scheme yet since it's still in BASIC & runs at a snails pace, but assuming a large file such that the [".BEGIN", ".END", checksum, file size] become relatively small, mine would do: 5/4*37/35 or 1.32 times the original file size. If I pick a more reasonable line length for the final version, like 75, it's only 1.28 times the original. I'm not sure what the maximum line length is on the net, but that seems reasonable (I think I only said about 15% after adding checksum etcetera). I guess it all comes down to what you feel is significant. If there's 2 million people on the net & they spend an average of 6 minutes a year down loading UUE files, it only saves them a minute each. If they're paying an average of $6/hour it's only worth about a dime each, but 2 million dimes is $200,000/year. Besides, who's the last guy to save you a dime without asking for a dollar in return? Anyway, the next 3 messages in this conference will be a SLOW basic program to encode files, one to decode, and the demo file. When I compiled the demo file I was using SDX & forgot to move the program above where DOS 2.5 & DUP.SYS like to go before I compiled it! It'll still load from the menu, & won't trash much if it's done as an AUTORUN.SYS file. I certainly wouldn't use the programs for anything other then testing. They're a pretty bad example & illustrate why I mainly use Action! (warning; confusing code here!). I used a D9: ramdisk for the test, so you'll have to change those lines appropriately for your system & hope I got the right versions of the programs. Thanks in advance to anybody that tries to get this thing to work or let's me know the reason why it didn't. Seems like there's more interest for curiosity sake, but at least I feel like I've proved my point. Besides, I think I just came up with a text compression routine <grin>.

I have been reading with interest your comments about Quick - "that great new language from Germany" - but since I have just recently begun reading this conference, what can you tell me about it? (Where to get it, etc.)

Thanks,
- Dag -

Man! Did those get trashed! Not sure if it was me, Portal, or my ST! Portal aborted after about 5 tries with Xmodem U/L on the 1st file & somewhere<?> stuff got appended to files. It doesn't seem to be me because when I view the files, they come out normally. When I read message #13 on my ST, the thing hangs & I have to manually disconnect. If anyone has a real problem with the files, let me know & I'll see what I can do. Otherwise, just remove the garbage from the end of the files.

Well, reprinted with Bill's permission:

Message : 12102 [Open] 12-07-92 7:25pm
From : Bill Wilkinson
To : Bill Esquivel (x)
Subject : The 7800
Sig(s) : 1 (General Information Files)
There is 1 reply

The 7800 was developed by General Computer Company back in Cambridge, MA (next door--literally--to M.I.T., with lots of work being done by MIT students/grads/etc.). GCC also did many, many Atari coin-op games back then (example: Ms. Pac Man, some of the driving games, others I don't remember--oh, yeah: Robotron).

As originally conceived, the 7800 would allow you to plug in a keyboard (I think into the cartridge slot, with the cartridge then extended out? But my memory is not clear on this) which would have an 8-bit standard SIO port, so you could hang any device you wanted off of it (printer, modem, etc., etc.).

The OS had hooks in it for all of this. The CIO/SIO was more simplistic than the standard 8-bit stuff: for example, if you wanted to grab any of the interrupts (display list equivalent, etc.) you basically had to take over the entire OS: no hooks a la CIO.

We modified Atari BASIC and Atari DOS to run on this CIO (which was written from scratch by a guy back at GCC). The DOS was much simplified: no command processor at all, only one file open at a time, only one disk drive available (with fully loaded RAM, you could override some of this by loading disk-based extensions...but we never got that far). The BASIC took over all the operations of the DOS command processor (shades of the C64, Radio Shack TRS80, etc.), so it had commands to ERASE, RENAME, PROTECT, UNPROTECT files, etc., etc. DIR of course. Seems to me I ...scratch that...I remember for sure: It even had FORMAT and FORMAT UNCONDITIONAL (FORMAT alone would give an error if the disk already had anything recognizable on it). No COPY, but I remember writing a COPY in the 7800 BASIC just as a demo, since the BASIC had BGET and BPUT built in.

Basically (no pun intended...though enjoyed) it was a neat little REAL beginner's computer. I think it was 24 by 32 character display, but not sure on that. I know the 7800's display list was only capable of 32 (or was it 31?) characters per display list entry. But the unique thing about the 7800 was that it had a "DISPLAY LIST LIST" which was a list of "DISPLAY LIST"s where each "DISPLAY LIST" described only 8 or 16 scan lines of the screen but allowed any number of entries for that segment, so

you COULD do 40 characters across by, for example, using two 20-character display list entries: one on left, one on right. Bizarre video processor; probably most powerful ever put on an 8-bit machine until the Nintendo arrived and wiped them all out.

As for prototype games, etc., they would likely be found back at GCC.

Incidentally, if you didn't know, after Atari folded the operation GCC moved into the Macintosh market and produced (still produces?) laser printers that understand QuickDraw and so do not have to have postscript drivers...cheaper and faster, presumably. Anyway, they lasted a lot longer than the 7800 did.

Well here goes..I'll try to answer as briefly as possible, if you
have any more questions send me email.
You can't run an MIO or a BB on an 800.
They need a PBI to hook up to so its XL/XE stuff.
They don't make MIOs anymore but you may be able to pick one up
used in a sale from here or Genie or CIS.
Both the BB & MIO have RS232s and printer ports and interface HDs.
The MIO now can be hooked to SCSI, SASI controllers and imbeded
controllers..(with HDFMTPH9.COM) to format imbeded controllers.
The MIO only stores data the standard 256byte blocks and stores
it backwards. The BB can go either way (its switchable) and it
can store in 512byte blocks like the ibm drives. Its compatible
with more drives than the mio.
OH yes..the BB is sold by CSS (716-429-5639 voice).
The BB has a number of attachments that make life wonderful for
the 8bitter like the floppy board that makes ibm high density drives
compatible w/atari and makes them go at lightning speed.
Both MIO & BB support high baud modem rates to 19.2k b.
Send me a disk and I'll put Kermit-65 on it and send it back.
My address is Joe Sabatino, 31 Skoplee, Girard, OH 44420-3308.
If you had access to the archive you could d/l it from there
using the BART mailer.

In article <1992Dec30.035608.22678@mtu.edu>, jjmcwill@mtu.edu (Jeff McWilliams) writes...
>Pardon my ignorance toward Forth folks, but what was the language designed
>for, and what are the PROS and CONS for choosing FORTH over some other
>programming language?
>
>Jeff McWilliams
>

I haven't used Forth for many years, and this is an "off the top of my head" answer, so I may be wrong.

As I recall, Forth was developed in the 70's by an astronomer. The name Brodie keeps coming to mind, but that could be a book author.(I'll look up the name if anyone really wants to know) From what I understand, it was a SW tool he wrote to control the positioning of large telescopes, and later got some use in the robotics disciplines. It was very "bare bones", and you were supposed to write your own routines for almost everything. In fact, every routine (called a word in forth) became an extension of the language.

It was the main language I used on my 400/800's, I got the 800 back in 1982, and since I was never real fond of basic I got the VALforth development kit. I heard rumors that VALForth was used internally by atari as a game development language. Later A PD Forth calle FIG-Forth was released and its core was as good as the Valpar Forth, but didn't have all the neat pre-packaged routines for things like PM graphics, strings ,trig, and the like, so you had to write your own. I kind of liked it because Forth is an interpreted language rather than compiled, so I could try out ideas without the edit-assemble-debug-edit-assemble-debug cycles that were time consuming with MAC65. (Remember, this is the early 80's before Action!)

Then I switched to C , and did no SW development on my atari for the last 5 years. Recently I started writing some small programs again (for my kids), but I'm using LOGO instead of Forth. I just can't deal with adjusting to Reverse Polish notation again.

Atari Logo is a very good implementation of LOGO, and I have free versions of Xwindows Logo on my unix machine and there's a really amazing free logo for MSwindows. Code portability from atari to X-LOGO or MSWinLogo is very good. If you want to write simple programs or teach your kids about computers, I highly recommend Logo.

Forth Pros:

Its portable to other machines. Of course, you have to write good code in the first place if you want it to port easily. I ported most my stuff to the PC without a lot of work when I started using it as my work machine and made the ataris strictly fun machines.

It's interpreted rather than compiled, so you get instant results.

Forth Cons:

The biggest con was the reverse polish notation. I got used to it, but it wasn't natural. In my opinion, the expression 2 2 + . is not clear as " add 2 and 2 and print the result. Doing anything in basic then became a problem, because the command "20 LIST" in forth will list screen 20, and you get used to it working that way. Then you do something in basic, and want to see line 20, so you type "20 LIST" by habit. Then you get to remember what line 20 was supposed to be, and retype it.

It's not as fast as Assembeler, and not that much easier to use than a good macro assembeler (once you get a few usefull macros in your library) For serious Atari 8-bit development, I think Action is probably a better choice, unless you plan to port to other machines that support Forth.

Forth as it exists today is a combination of a threaded interpretive internal structure with reverse polish notation.

It's a whiz kid at aiding the rapid development of just about anything with its strength being things like device drivers (the SparcStation boot rom is a Forth interpreter). Since it's a structured language, however, it is suited for more general purposes as well.

Its RPN version of 1 * 2 + 3 looks like 1 2 * 3 +; if(condition) then a else b looks like: condition if a else b then. The reason for the basackward appearance is because Forth uses a stack for all parameter passing. The would-be Forther would find him/herself immersed in dealing with the stack. If you plan on learning assembly language, you must deal with its return stack (since being careless when dealing with it almost always results in a crash). In addition, most Forth systems have an assembler (which is also reverse polish: LDA #4 looks like 4 # LDA,)

Forth also has a dictionary structure which holds forth 'words', the operations of Forth. You can add to the dictionary and use your new word immediately; it's now part of the language. The definitions of most Forth words are sequences of Forth words; in fact, 80-90% of most Forth systems is written in Forth itself.

Since you can make a new word and test it immediately at the keyboard, development is quick. Forth isn't like most languages; definitely doesn't look like most anything normal and Forth has been spoken of as the most unreadible languages in the universe, surpassing even C! However, like any other expression, the writer has a chance to write comments so he can remember what he did 6 months ago (if not just yesterday) and do so in a readible style.

Forth takes about a month of fairly solid hacking to learn enough of it to be truely useful. Once at that stage, you can learn the internals of Forth, concentrating perhaps on how the if, else and then words work or maybe on its interface to the machine.

In summary, Forth can be a learning experience to make the transition to assembly programming, a desk calculator (mostly integers), a prototyping environment (where you can see what your - say - game - will eventually look like) or a serious development language.

Yes! Other then simple stuff like right margin, I'd like another
VBI vector. Since the XL series only have 2 joysticks, they currently
read the first 4 pots, then copy those values into the next 4 pot regs.
I would like that to be replaced with start-up code that puts an RTS
some where in RAM, then jumps to it rather then copy the pot values.
That way, all you would have to do is put your continuation code after
the RTS, a JMP <ROUTINE> or actual routine, then just store a NOP where
the RTS used to be. Your routine would then run every VBI & would be
simplier then the current process.

Dave,

Hey,thanks for the great insight into Forth. Reverse Polish notation
is something I dread, and hate. I refuse to purchase a new expensive
HP calculator because is uses RPN. Instead, I keep buying the
TI calculators. I guess that is also why I never really looked into Forth.
Yes, I have Action! now, and I like using it better than Lightspeed C, or
Pascal.

Hmm, that sounds interesting. But where would you put the VBI vector?
Down on Page Zero somewhere? You would have to steal 3 bytes, for the
JMP ADDR to replace the RTS. Well, I'll be sure and get the hardware
debugged and built as soon as I get the parts.... so that I can
publish the modification. It sounds like we could see some really
interesting operating system upgrades come out of this hardware project.

Forth was designed by the astronomy community for real-time telescope control.
It is fairly efficient, producing code which runs close to assembly or Action
in speed. It is, however, very different from most other languages in concept
and in practice. There are many public domain implementations of Forth for a
wide variety of platforms, possibly some commercial versions as well.

Forth provides a 'kernel' of defined keywords, and the means to add your own in
an interactive environment. All editing, compiling, and execution are done
within the Forth environment; code is edited on text screens which are compiled
directly into memory at 'load' time. Forth uses an explicit stack for input
and output arguments, and Reverse Polish Notation (2 3 + instead of 2 + 3);
it could be considered object oriented programming, in a way.

Charles Moore is the inventor. Leo Brodie wrote a few good books on it, including "Starting Forth" which is a good one for beginners, and "Thinking Forth" which is pretty good for those planning to use Forth for lots of development.

Just a sort of side note: Personally, I don't think postfix notation is any great barrier to learning Forth. One thing better about postfix (compared to infix) is that it is very orthogonal: every command has the same syntax, which is just a number of arguments on the stack. (Forth does violate this when dealing with a few things like strings, though).

Later,
Steven Ourada
